Editorial Memo ......294

The patent laws provide that any new and useful art, machine, article of manufacture, composition of matter, or design, or any new and useful improvement thereof, may be patented if the act of invention is involved. Therefore, every inventor with a valuable invention should take advantage of the patent laws and proceed for patent protection in order to safeguard his rights.

A patent gives the inventor the exclusive right to prevent others from making, using, or selling the invention claimed in the patent for a period of 17 years.

The patent laws were enacted for the benefit of the inventor to give him protection for the features of his invention which are patentable. These features must be properly and concisely set forth and claimed in a formal application for patent in order to comply with the requirements of the U. S. Patent Office. For that reason, the Patent Office advises the inventor to engage a competent registered patent attorney to prepare his application for patent and represent him before the U. S. Patent Office Examiner.

A specially prepared booklet containing detailed information with respect to patent protection and procedure will be forwarded to you without obligation upon request.

CLARENCE A. O'BRIEN & HARVEY B. JACOBSON

62-K Adams Building + Washington 4, D. C.

you're that man, here's something that will interest you.

Not a magic formula—not a get-rich-quick scheme—but something more substantial, more practical.

Of course, you need something more than just the desire to be an accountant. You've got to pay the price—be willing to study earnestly, thoroughly.

Still, wouldn't it be worth your while to sacrifice some of your leisure in favor of interesting home study—over a comparatively brief period in your life? Always provided that the rewards were good—a salary of \$3,000 to \$10,000?

An accountant's duties are interesting, varied and of real worth to his employers. He has standing!

Do you feel that such things aren't for you? Well, don't be too sure. Very possibly they can be!

Why not, like so many before you, investigate LaSaile's modern Problem Method of training for an accountancy position?

Just suppose you were permitted to work in a large accounting house under the personal supervision of an expert accountant. Suppose, with his aid, you studied accounting principles and solved problems day by day—easy ones at first—then the more difficult ones. If you could do this—and if you could turn to him for advice as the problems became complex—soon you'd master them all.

That's the training you follow in principle under the LaSalle Problem Method. You cover accountancy from the basic Principles right up through Accountancy Systems and Income Tax Procedure. Then you add C. P. A. Training and prepare for the C. P. A. examinations.

As you go along, you absorb the principles of Auditing, Cost Accounting, Business Law, Statistical Control, Organization, Management and Finance.

Your progress is as speedy as you care to make it—depending on your own eagerness to learn and the time you spend in study.

Will recognition come? The only answer, as you know, is that success does come to the man who is really trained. It's possible your employers will notice your improvement in a very few weeks or months. Indeed, many LaSalle graduates have paid for their training—with increased earnings—before they have completed it! For accountants, who are trained in organization and management, are the executives of the future.

#### Write For This Free Book

For your own good, don't put off investigation of all the facts. Write for our free 48-page book, "Accountancy, The Profession That Pays," It'll prove that accountancy offers brilliant futures to those who aren't afraid of serious home study. Send us the coupon now.

Over 2300 Certified Public Accountants among LaSalle alumni G. I. APPROVED

# Design for DYING

THIS is not a pretty picture. It shows the the survivors: the dead were ugly refuse. L design of a woman's dress photographed We Americans should not be spared these on her flesh by the flash of an atomic bomb. It was taken from Japanese motion pictures made in a first-aid station in Hiroshima, but only recently released.

Why were these pictures withheld from the American public for a full year? Are we, the people who developed the world's final weapon, being shielded from its horrors?

Some of us have seen other pictures of what radiation does: men without eyes and ears, children with shriveled clumps of fingers that will never be hands. These were

sights. We need to be aroused in every way possible to the brutal truth that there is no defense in atomic warfare. Back from Bikini, Admiral Blandy himself has underlined this repeated warning of the scientists.

Radiation, invisible and insidious, will ultimately account for the unfortunate survivors of atomic blasts. Radioactive dust will sift into the air-conditioned caves. And no cave of thought is deep enough. .

Peny Githrus

# Are You In Tune With The Infinite?

HAS your whole being ever pulsated with a mysterious exhilarating thythm? Have there been days when life suddenly and unexpectedly seemed especially enjoyable—when all of nature and yourself seemed to be swept up in a silent symphony of ecstasy? Have you longed to sustain such occasional experiences because of the self-confidence and peace of mind that they instilled within you?

High above the earth lies the cause of such strange phenomena. Within the canopy of space great worlds revolve at constant speed. With preciseness not conceivable by man, stupendous universes retain their relative distances—energies unwaveringly oscillate to and fro. Such is Cosmic motion—the orchestration of the infinite. If reducible to sound, it would be music Divine! 'Yet, silent as it is, this music of the spheres, this Cosmic harmony, prevails throughout all nature. The smallest living thing and the largest universe, alike, have their particular note in this scale of rhythm.

There are ways to attune yourself with these Cosmic and natural forces! There are ways in which your being may be continuously stimulated by this harmony of nature, resulting in an influx of greater personal power. The Rosicrucians (not a religion) are a world-wide philosophical fraternity. Let them show you in simple words how to attune yourself, mentally and physically, with the Infinite for the fullness of living.

# You Can't Be a CHAMP's With a CHUMP's Body!

Let Me Prove I Can Make You A New Man In Only 15 Minutes A Day

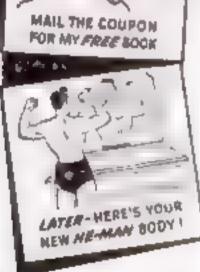

HAVE YOU got a weaking body that others can 'push around'? Are you askamed to strip for sports or a swim. Then it a about time you GOT MAD—mad at letting other fellows walk off with the prettiest girls, the finest jobs, the best things of life. Mad enough to DO SOMETHING about it—to

give me just 15 minutes a day

GET MAD AT HOW YOUR BODY LOOKS FOOM

Then I'll PROVE you can have a body you'll be proud of packed with red-blooded vitality! "Dynamic Tension." That's the secret! That's how I changed myself from a scrawny, 97-pound weakling to the winner of the title. "World's Most Perfectly Developed Man."

## **Just 15 Minutes A Day**

YOU can have big, broad shoulders—a fine, powerful chest—arms bulging with "amash"—legs rippling with muscular strength—a stomach ridged with sinewy muscle—and a build you can be proud of!

Just give me the chance to PROVE that "Dynamic Tension" can build this kind of "he man" body FOR TOU! Just 15 minutes each day is enough to show amazing results! What's more, it's actually fun—because "Dynamic Tension" does the work"

## "Dynamic Tension" Does It

"Dynamic Tension" turned ME from a sparrow-chested nobods into the powerful HE-MAN I'm proud to be today. So if you're a weakling like I was, it s time YOU got mad—and changed that bag of bones into a handsome powerbouse of brawn and mascle

I want to PROVE I can give you a sledgehammer flat; a mighty forearm, add inches to your chest build a coat of muscle straight arross voir stomach, change your spindly always tired" less into vigorous columns of speed and staming. My free book shows how YOU can get that kind of real "he-man" build"

## MAIL COUPON FOR FREE BOOK

Get the facts /cri' I want to show you how my method works? Mail the coupon right now and I it send you a \* H.F.E copy of my famous .liustrated book. Everlasting Hearth and Birongth

This Free Book tells you in plain, straight from the abounder language all about "Dynamic Tension"—and what it has done for others. It shows before and after photos of each I've changed from weakings into Atles Champion—tells what they have to say. And it tries how I can do the same for YOU—in only 15 minutes a day! So don't put it of! Address one personally CHARLES ATLAS, Dapt. 1K, 115 East 23rd St., New York 10, N. Y

# INVENTORS

Office advises—unless the inventor is qualified to handle such matters—that he employ the services of a competent Patent Attorney in the preparation of his Patent Application. We are Registered Patent Attorneys fully qualified to represent you at the Patent Office. Our long and varied experience in patent practice, we believe, enables us readily to understand inventors' disclosures, to advise what is probably patentable, after conducting preliminary patentability investigation of prior U. S. patents, and to draw your specifications and claims in such manner as to present clearly the novel features.

# Patent Laws Favor the Inventor Who Acts Promptly

Remember, the details of your invention do not have to be 100% perfect before you can obtain patent. Unwise inventors often devote considerable unnecessary time working on unimportant details of their devices. This is expensive, hazardous and unnecessary. First step is to have us conduct search for the prior U.S. patents and render a report as to its patentability. Our Search Report is very valuable to you in that it clears up the course you should take in regard to your invention. If our Report is favorable, this report of the patentability of your device shows that your chances of patent protection are in your favor.

### **Have Patent Protection First**

Unless you saleguard your invention by obtaining a patent, thereby securing a monopoly on same, it may become "public property," free to be made, used and sold by anyone, or it may be patented by some other person.

#### How Old Is the Dial Phone?

Sir:

On page 103 of your August issue . . . an article states that the dial telephone is only 35 years old. I saw them over 40 years ago in Grand Rapids. They were not so compact as the phones of today, but they were dial phones.

L. R. COLVIN

Grand Rapids, Mich.

The idea behind the dial phone is almost as old as the telephone itself, and an automatic switchboard was actually used in Indiana as early as 1895. When PSM said there were no dial phones 35 years ago, it was thinking of regular service rather than isolated experiments. The first complete panel-dial central office in the Bell Telephone System was put in service at Omaha in December 1921.

#### An Unger to the Rescue!

Sir:

In a recent issue I noticed a letter from an L. Unger, Batavia, Java, N. E. I. He evidently got pretty hard hit by the Japs, and seeing that he is such an ardent reader of Popular Science Monthly I have rounded up all issues of the years 1942, 1943, 1944, and 1945 (which he was prevented from seeing), and want to ship them to him . . . Charles F. Unger

Sacramento, Calif.

To generous Reader Unger of Sacramento, PSM promptly dispatched the street address of his bereft namesake on the other side of the world.

### Non-Northern Lights

Sir:

I recently witnessed a display of aurora borealis, unusual to me in that the focal point of all streamers was directly overhead.
... I would like to know if there are other

records of such displays, as all those I have seen heretofore seemed to have their focal points in the northern skies.

MARTIN HAWRYLOW

Oshkosh, Wis.

Many examples of the corona aurora, as it is called, have been recorded. The focal point is generally centered on the magnetic zenith, but the earth's curvature produces the illusion that it is directly overhead.

#### With Pleasure

Sir:

The Department of Marine Engineering of the United States Naval Academy is revising its text on engineering materials and processes. . . . It is desired to include illustrations of the open-hearth furnace and blast furnace. I notice sectioned perspective illustrations of these two furnaces framed here at Carnegie Tech with a Popular Science credit.

If from this description of the illustrations you can find a copy suitable for reproduction . . . I would appreciate having it.

B. F. Brown Lieutenant, USNR

Pittsburgh, Pa.

Proud and happy to be of service, PSM has sent the pictures to Lieutenant Brown.

#### Heaven Forbidl

Sir:

When I saw the umbrella that permits use of both hands (PSM, June '46, p. 102), the first sensation that swept over me was that it would go over big as a woman's hat.

ROCER DITTMAN

Van Nuys, Calif.

#### Correction

Sitt

We are manufacturers of . . . Lite-A-Lok, described in your August edition. However, your item said that the Home Products Co. was of Chicago rather than Adrian, Michigan . . . .

# THEY BUILT THEIR OWN

MANY veteran students are now attending N.Y.T.I. of N.J. under the generous provisions of the G.I. Bill of Rights, which allows any approved school of the veteran's choice to charge the Veterans Administration up to \$500 a school year against the educational expenses of qualified veteran students. Full-time students, with dependents, are also paid a sub-

Student Walter E. Stevens, making engineering checks with \$395.00 United States Television Sweep Generator. The school is lavishly equipped with the most advanced test equipment.

sistence allowance of \$90 monthly by the VA, and those without dependents, \$65. Many students hold part-time jobs, thus augmenting their monthly payments. However, you do not have to be a veteran to be accepted as a student.

A considerable number of out-of-state students attend the school because of its excellent, practical type of radio and television courses,

so difficult to get anywhere else in the world today. Living quarters are obtainable by single students, but married students report considerable difficulty in finding quarters for their families.

No high-school diplomas are required. Every student must have at least a grammar-school education, however. And the school requires that a student be earnest, sincere and technically inclined. Students without proper mathematical backgrounds are taught the radio and television mathematics they need.

You probably have been wondering what N.Y.T.I. of N.J. means. It stands for the New York Technical Institute of

An Advanced Class in Television at NYT1 of NJ., famous television school, and the 17-tube television sets they built. Students at this school have been building television sets as part of their courses since 1939, when television programs were first broadcast regularly. School officials

found that this practical method of instruction is productive of very satisfactory results. Each student may build a set and keep it to use in his own home laboratory, if he chooses to. The school is located in the heart of the radio, television, electronics industry.

# TELEVISION RECEIVERS!

New Jersey, a resident school located in New-ark, N. J., just across the river from New York City (Only 20 minutes from Broadway by sub-way or train). The school is located in the heart of America's great radio and electronics industry. Such leading television, radio and electronics manufacturers as Western Electric, Du Mont, Federal and Edison are nearby. Newark also is near Radio Stations WJZ, WEAF, WABC and WOR; each a leader in broadcasts going on networks all over the country. This means that the school offers numerous advantages, as it is in touch with most recent devel-

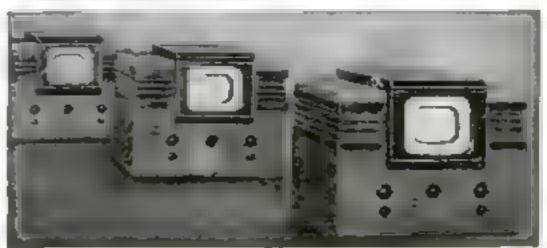

opments in radio and television. This also means that qualified radio and television engineers are available to the school for teaching purposes.

During the war N.Y.T.I. of N.J. was approved for the training of Signal Corps personnel by the Army. When the war ended the enrollment increased because of the influx of veterans desirous of getting practical television training. At the present time, there are

120 openings for new students for the several classes beginning in October & November 1946.

The school issues a special Bulletin, Numbered 310, which illustrates and describes its facilities and equipment and shows students using its varied laboratory equipment. Bulletin 310 also describes classes that may be attended, housing conditions, costs, hours, etc. To get complete information write for Bulletin 310 (for which no charge is made) to the New York Technical Institute of New Jersey, 158 Market Street, Newark, New Jersey.

A line of RCA television receivers used for comparative test purposes at N.Y.T.I. of N.J.

# PATENT PROTECTION for INVENTORS

#### A PATENT IS A VALUABLE RIGHT

On the basis of a provision in the Constitution of the United States, Congress has established a system under which inventors may secure the exclusive right to prevent the unauthorized use, manufacture and sale of their inventions for periods of seventeen years. The inventor secures this protection by obtaining a patent from the United States Patent Office.

> Victor J. Evans & Co., has a staff of experienced registered patent attorneys, available to represent inventors in the preparation and prosecution of their cases before the Patent Office. Detailed information and the steps to be taken in obtaining patent protection will be furnished upon request,

ARE YOU A VETERAN:....

# SO IT NEEDS FIXING

By S. T. CHRISTENSEN

the "Fix-it Man"

"A #ELL, I guess I'm the fellow to see, for I've repaired thousands of refrigerators (home and commercial both), vacuum cleaners, radios, washing machines, irons, fans, lamps, mangles, motors, etc. In fact, many of my customers call me their "electrical appliance doctor." And "doctoring," I might add has paid me a good substantial income for quite a few years. Funny, in a way, how I got started. Always liked to tinker and by experimenting around I found that most electrical appliances had many things in common. That, regardless of what the appliance was used for, or who the manufacturer was, the basic principles were much the same. From fixing my own appliances to fixing friends' and then for strangers at a fee, seems now to have been but a small step-

#### What to Charge?

At first, I let the owner decide the charge and, frankly, I was amazed at what I carned per hour. But then, when one figures what initial costs are involved in buying most electrical appliances, one can readily see that spending extra dollars for repairs is well worth while. Before long I was making more in my spare time repairing than from my regular job. The result . . . I went into business for myself. When war came, business boomed, for new appliances were not available.

For a while, repair parts (needed on some jobs) were a little difficult to get. But that

situation quickly adjusted itself and many repair parts were given the high priority rating of AA2. After all, we had to provide for the health and well-being of our civilian population.

#### The Future Offers

Friends ask me about my future. And, I think I've got a grand one. Age is no handicap in repairing. I have in my files enthusiastic letters from repairmen ranging in age from 18 to 79 years. Now the war is over we are certain to see hundreds of new products on the market . . . products that the average person never dreamt of. These new products and our old appliances are all going to need at some time or other "fixing." Well, I'll still be the fellow to do it. The field open for appliance repairmen is unlimited. I don't worry at all about too much competition.

#### If You Are Ambitious

To the contrary, I've prepared a complete course, chuck full of simple, easy to understand photos and drawings and written in the same non-technical language as this article. I know the course is good, because I have hundreds of men all over the country writing to me telling me how the course has helped swell their pockets with cash. If you too want to prepare now for your future, I suggest you read the next page and send me the handy coupon."

If now employed, start your home appliance repair business NOW in your spare time and be set with a business of your own no matter what happens. You don't need elaborate flatures or expensive equipment to be a successful repairman. Operate from your garage, basement, vacant store, etc. Work as many hours as you wish—the home appliance repairmen is his own boss. It is a profitable occupation for on many types of repairs it is not unusual for a repairman to charge on the basis of \$5.00 to \$6.00 per hour. Don't gamble with your future-learn a trade that will always support you. Remember, as long as electrical appliances are used, there will be a need for electrical appliance repairmen.

if you are at all mechanically inclined—can hold and use tools—then you have all of the qualifications required for becoming a big money earning home appliance repairman. It does not matter if you have not had a great deal of schooling or had previous experience along these lines-WE WILL TEACH YOU. Age should be no barrier—nor should any minor physical handicap.

## New Course Tells All

Profusely illustrated, our new course shows you in simple, easy to understand language and drawings how to make each repair on refrigerators, vacuum cleaners, washing machines, motors, etc. Explains and gives you a working knowledge of electricity, welding nickel plating, etc. Shows you how to build the power tools you need and how to solicit and keep business coming to you. Not a theory course but an honest to goodness course written by and used by repairmen the country over. Price of course is so low that the savings on your own household appliance repairs will quickly buy for it. Act now! Mail the bandy coupon below today

#### ————Read What Our Students Say About Course————

I really believe your course the best investment a mechanically minded then can make.-Claude S. Allen, In-

dianapeds, Ind.

| have received your Course in Appliance Repairing and I must say I am well Diseased with same. I am only sorry I did not have said Course some rears ago. I have learned so much more through this course I would not part with ton, Ohio.

The Course in Appliance Servicing errived a few days ago, Want to take out a few minutes of my rainable time to let you know that this is just what I have been looking for ever since I opened up my Fix-It shop. I must admit that you told the truth when you said that it contains quite a bit more information than ! bargained for. -Bretl. Sebring. Obio.

are a mechanic for the Western Union Telegraph On. Three days after reselving the lessons in refrigeration I sarned the -Henry S Lee, Washing-LDb. D. C

## Student Finance Plan

Let me show you how to prepare for a GOOD JOB NOW-Get Ready QUICKLY for the field that offers STEADY

Start now to prepare for a Lifetime of Success. Get into Electricity, the essential field that will continue to offer good pay and a real future all through the years. Coyne trains you, NOT by correspondence, but by actual shop work right on real electrical machinery. Then on my "STU-DENT FINANCE" PLAN YOU CAN PAY MOST OF YOUR TUITION IN EASY MONTHLY PAYMENTS AFTER YOUR TRAINING PERIOD IS OVER.

In the Big Coyne Shops you get practical "all-around" training by setual work-not by correspondence. No advanced education or previous electrical experience needed. Many of my students had no previous experience. Others had experience in one or two branches but realized they needed all-around training for the better jobs and advancement.

#### Earn While Learning

If you are short of money and need part-time work to belp pay for your room and board while training, my Employment Department will help you get a part-time job. When you have graduated, they will give you Lifetime Employment Service.

#### Learn by Doing

You get practical "Learn-by-Doing" . wring, tratailing, operating, testing, repairing and servicing various types of Electrical and Electronic equipment . . . you work on real armatures, motors, generators. refrigerators, electronic controls, etc.

JOBS LIKE THESE Power Plant Work
Armature Winding Substation Operator
Maintenance Electrician
Electrical Testing
and Repuir figual Maintenauce Industrial Electronice Electric Refrigeration and many others Our Employment Pureaufor graduates gives FREE Lifetime employment service.

PREPARE FOR PERMANENT

Industrial Electronics and Electric Refrigeration Training Now Included

Added training in these two great fields is now included with my Electrical Course. Industrial Electronics and Electric Refrigeration offer big opportunities. Get BOTH at Coyne |

Matienal School of Mest Cutling Inc., Dept. 0-47, Toledo 4, Ohio

"He had the foresight to know that the man who is trained in plastics gets the best opportunities. He took the Plastics Institute course and enjoyed every minute of it. Of course he learned a lot, there are so many interesting things to know about plastics. But it paid off... and now we can afford the luxuries we've always wanted..."

People all over the world are saying similar things. For Plastics Institute, America's oldest and largest plastics educational organization that devotes all of its facilities exclusively to plastics, has trained men in every section of the world. Hundreds of testimonials telling of fine positions and booming new businesses prove the value of the Plastics Institute course.

LEARN AT HOME -Continue your present job and learn plastics in your space time! The thorough, easy-to-understand course presented by Plastics Institute requires no previous technical experience.

A COMPLETE COURSE\_Everything you should

know about plastics is included . . . materials, designing, molding, fabricating, laminating and testing. You will acquire a basic knowledge of plastics that can be invaluable in getting you the type of fine position you want in this great, new industry.

YOU MAKE THINGS—To give you practical experience in working with plastics, we supply handsome, colorful, rods, sheets and tubes of plastics from which you can if you wish, make useful, attractive creations. You cement, saw, buff, form, dye, decorate, cast and laminate various types of plastics. You design plastics articles—develop your own ideas. You may earn money while learning.

START YOUR FUTURE TODAY—Mail the coupon below, now! You will get an interesting, illustrated, free booklet with worthwhile information about plastics. You will see how, at small cost you can prepare for a bright future in the booming plastics industry. Clip the coupon and mail it TODAY!

Outweighing its closest competitor (the 72-ton Douglas Globe-master) by 40,000 pounds, Lockheed's Constitution, biggest land-based transport (see page 75), squats on 10 wheels. Eight are tandem-paired main wheels; the other two are the nosewheels, which retract into the gaping maw above.

## Diesel, steam or turbine, a huskier Iron Horse emerges from a quiet revolution in railroading.

#### By DEVON FRANCIS

AT THE foot of a steep grade in the Allegheny Mountains a bunch of railroad men sat on their haunches in a semicurcle the other day looking dubiously at a spanking new Diesel-electric locomotive. The engineer in the cab proposed to pull a long string of passenger cars over the ridge ahead without "double-shotting"—without a helping locomotive. It had never been done before on this grade.

"You'll never make it!" yelled one of the onlookers to the man in the cab.

"Want to bet?" the engineer yelled back, adding some picturesque expletives.

He eased open the throttle. The cars obstinately braced themselves as the Diesel muttered heavily. The wheels moved, snail-like at first and then with increasing assurance. Up the grade went the train, over the top of the ridge.

Another bit of railroad history had been made, without fanfare.

At the head of that string of cars was one of the new postwar locomotives, product of an effort to put more power on wheels to pull greater loads faster on the 228,000 miles of the nation's rail system. Produced at the Schenectady, N. Y., shops of the American Locomotive Company, it develops 2,000 horsepower in one unit. A unit, in railroad parlance, is a single frame or car.

In building that much horsepower into a unit, Alco had done nothing to awe the casual railroad passenger. The Baldwin Locomotive Works at Chester, Pa., had, in fact, done even better. Into another postwar Diesel-electric it had crammed 3,000 horsepower. Two of the Baldwin units hooked together produce 6,000 horsepower, as much as a mammoth steam locomotive.

These lusty locomotives looked like any other Diesels. Yet the 2,000-horsepower job was unique under its shining steel skin. The reasons were subtle. They could be fully grasped only by railroad men interested in getting more goods and people from one

2-8-8-0 type (16 drivers), generally used to houl heavy coal and one trains where grades are steep.

4-8-8-2 ail-burner, used only by Southern Pacific, seems to go backward. Cab is ahead of bailer.

4-8-8-4 type is the "Big Boy," world's heaviest and most powerful. It is used only by the Union Pacific.

4.6.4 Hudson type, today's most popular highspeed passenger engine where hills are moderate.

0-4-0 type switcher is used for light switching on industrial tracks where clearances are restricted.

2-8-8-4 type is the "Yallowstone," so named be-

0.6.0 type switcher, a versatile performer, finds employment in passenger and freight service, too.

2-8-8-2 type wins its greatest popularity in haufing heavy-tonnage trains in mountainous territory.

A-B-C-D Diesel-electric locomotive. The Rock Island owns this 5,400-hp. engine

From "Glants of the Rails," by S. Kip Farrington, Jr.; Garden City Pub. Co.

point to another faster and at lower cost.

To the public, the rash of new locomotives meant only a lot of good-looking chrome and a saving in time. The passenger wasn't aware that he had a front-row seat at a revolution in rail transportation's prime mover, the locomotive.

It had to come. Even discounting the growing competition of the air lines, the railroads were in for a housecleaning. The weight of freight and passenger trains had almost doubled in two decades. Freight speeds had increased by half, the pace of passenger trains by a fifth.

So U.S. locomotive makers were badgered by the railroads to produce something better. Out of their researches have come several conclusions:

The Diesel-electric is far from reaching the peak of its efficiency.

The steam locomotive, an object of sentimental attachment to railroad lovers the world over, is still in there chugging—has only begun to realize its potential power.

Locomotive improvement, in the light of atomic power, may be at a threshold rather than an end.

The fundamental problem in locomotive

design is that of packaging power. A locomotive built to negotiate every mile of standard-gauge track in the United States can be no more than 15 feet 2% inches high, 10 feet 6 inches wide and 115 feet long. Into a space approximately that size in a steam locomotive (articulated Diesels can be longer), designers have to squeeze as much power as is produced by stationary power plants covering a city block. Track clearances, curves and weight limits forbid making locomotives much bigger.

The Diesel-electric is, of course, the most beribboned package on the shelves of the locomotive makers. It has no peer as a switching engine and in some respects as a road engine. It is reliable. It is powerful. It doesn't burn up fuel, as a steam locomotive does, when it is standing idle between jobs. It consumes practically no water.

Diesels for the road have almost doubled in number in the last two years. Most of these have been produced by the Electro-Motive Division of the General Motors Corporation at La Grange, Ill., while competitors were making steam locomotives by government directive. Today there are more than 5,500 Diesels on order or in service,

A locomotive is built around its frame. The frame on which this workman is sitting weight 62,500 pounds and is cast and welded. Parts pictured on these two pages are not necessarily parts of "Big Boy," the giant shown in the panel below.

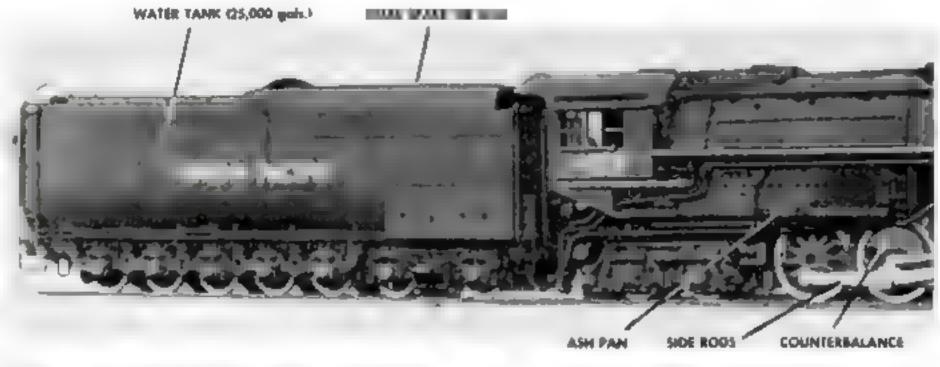

and 1,500 of these are road locomotives.

Until the advent of the Diesel, the fastest time between Chicago and the Pacific Coast by rail was 53 hours. The streamliners cut that to less than 40 hours. Next year the Diesels will lop eight hours from the Southern Pacific Sunset Limited's time from New Orleans to Los Angeles, and the Milwaukee Road will trim 18 hours from its Chicago-Seattle run.

That isn't all a result of sheer speed. Steam locomotives are just as fast, but terminal delays lower their average.

Another advantage of the Diesels is their articulation. At any junction point a two-unit Diesel can be split in half to carry two parts of a train in different directions.

What damns the Diesel is its purchase price. If a steam locomotive costs \$85,000, a Diesel-electric of comparable power will probably cost \$200,000. A lesser disadvan-

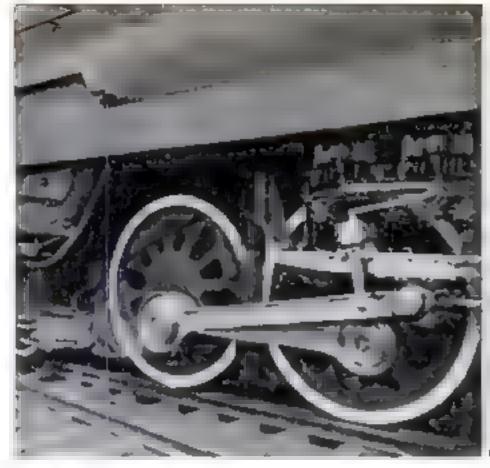

Engine power is transmitted to tender, and thence to a train, by the lower of the two bars shown below, at left. Five inches thick, it has a tensile strength of 47,000 pounds per sq. in. Upper bar is a reserve, to take load if the bottom one breaks,

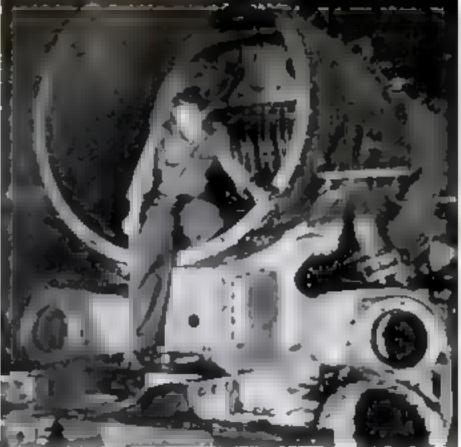

Below, at left, is a 70-inch driving wheel, with counterweight apposite bearing. Rad that actuates piston valve attaches to small bearing on the end of L-shaped arm. To the right are a steam locametive's pistons, grooved for rings as in a gas engine.

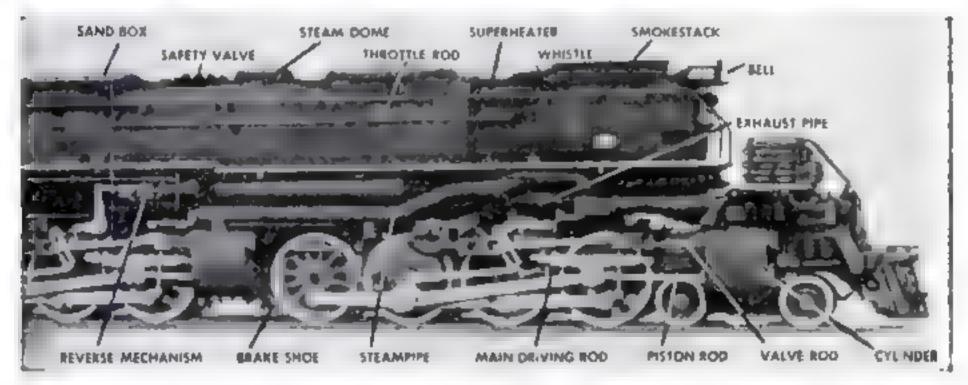

The parts of a locomotive tell many things about it. If there are small levers on the driving rade, as shown above, it means that the engine has ald-style piston valves rather than popper valves, which give greater efficiency at high speeds.

Behind the workman perched in the opening of this unfinished boiler are the superheater pipes where the steam is "dried" to increase engine efficiency. Pipe at right of boiler conducts steam to valve compartment and then to the main cylinder.

tage of the Diesel is its great weight and length. A steam locomotive a little more than 100 feet long, tender included, and weighing 465 tons develops 6,000 horse-power. For the same horsepower a Diesel must be at least 180 feet long and weigh, normally, 575 tons. Another nunor drawback is that, while the Diesel consumes no water, it still must manufacture steam for heating purposes and for air conditioning. Providing a boiler big enough to make that steam is giving Diesel users some head-aches.

The Diesel's large number of powered axles, on the other hand, give it a "tractive effort" that virtually eliminates wheel slippage and jerking.

Basic to the railroads' demands for newer locomotives is the rivalry between companies. The railroads are almost womanish in fretting over the appearance of their

locomotives. One road doesn't want engines that look like another's, so most steam locomotives are custom-built. The railroads can't do much about the appearance of the Diesels, though. They are as alike as peas.

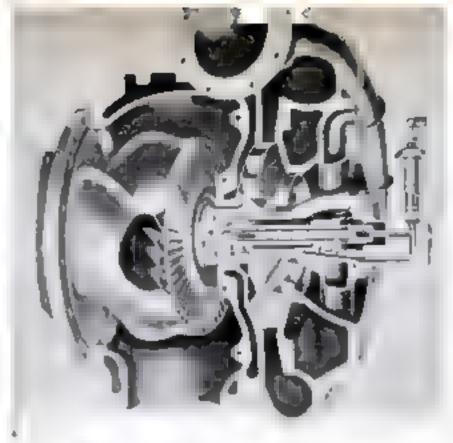

Nonetheless, the Diesel is a slick competitive article to advertise to the public. The locomotive that went over the Allegheny ridge—sneak-tested on the rails of the Lehigh Valley—has gleaming stainless steel sides because the Santa Fe (see cover) ordered it that way

So, many more Diesels are being bought. The improvements in them hinge largely on putting more power in lighter single units on fewer wheels. On that basis, Alco claims that up to now it has the best of the breed.

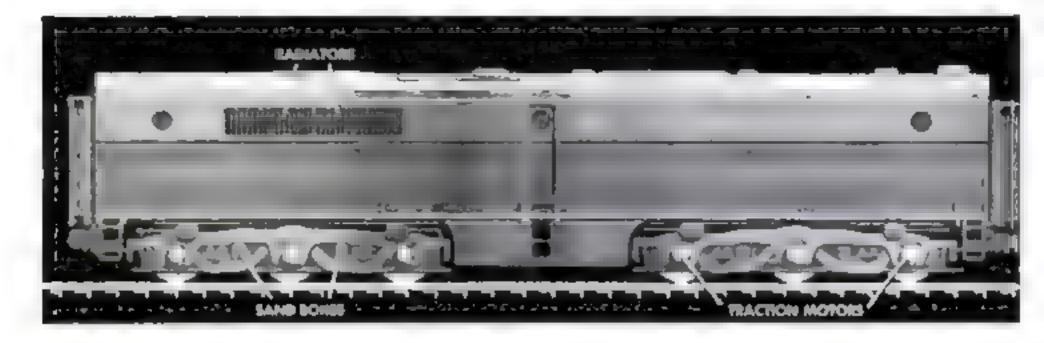

The steam locomotive was written off as dead when the electric engine made its debut in 1895. A funeral oration was prepared for it again when, in 1934, the Chi-

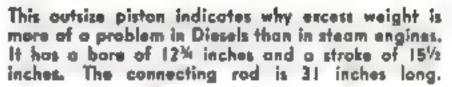

Each of a Diesel's blower-cooled traction motors, like the one above, is geared to two wheels. A 12-wheel Diesel like the typical A-and-8-unit engine below usually has four motors, four idler wheels.

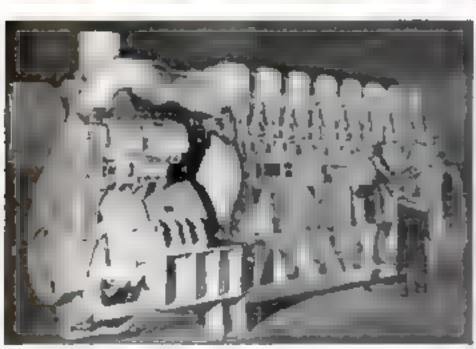

Diesels, like aircraft, have superchargers to pack more air into the cylinders. In this one, the exhaust-driven turbine turns the blower at approximately 10,000 r.p.m. at full load and full speed.

Below, an eight-cylinder, 1,500-hp. Diesel engine. Above it is the 4,515-pound crankshaft required by power plants this big. Engine itself weighs 38,500 pounds; generator, in foreground, 14,000 pounds.

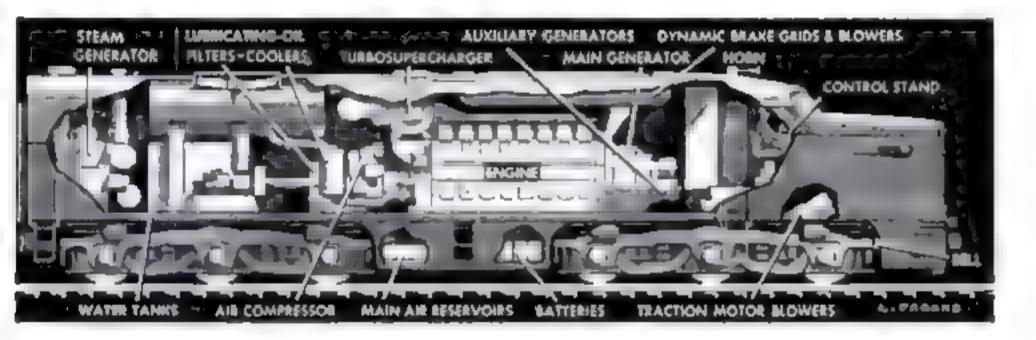

70 SCIENCE

Uncrated after shipment to the locomotive factory, a generator awaits installation in an engine. The little generator on top is an "exciter" for its huge counterpart and supplies auxiliary power.

Diesel cabs are simpler than those of steam engines. Engineer holds throttle air-brake handle is beyond his hand, reverse lever below it. The throttle in an A unit controls engines in all other units.

cago, Burlington & Quincy introduced the high-speed Diesel-electric road engine.

But the people who liked steam went right ahead, despite the frightful thermal inefficiency of steam (the ability to turn heat into mechanical energy), and today there are still 13 times as many steam locomotives as there are of all other kinds put together.

That's because thermal efficiency is a secondary consideration with the railroads. A steam engine gets only six to nine percent of the useful energy in coal as compared with a Diesel's 23 percent harvest from its fuel oil, but the steam engine's coal is cheaper. Steam, in fact, retains a slight edge on oil in operating costs.

There is an added and equally practical reason for the persistence of steam. The best freight customer the major railroads have is the coal-mining industry. Between rails and mining there is much mutual back-scratching.

But beyond that is the steady improve-

ment in the steam engine. It has undergone refinements in combustion. It has more power. Baldwin's T-1 type consistently makes 85 m.p.h. on the open stretches for the Pennsylvania Railroad with a load of 15 passenger cars (some 1,200 tons), and betters 100 in spurts

The manufacturers keep adding power by boosting the pressures and temperatures in steam boilers. Greater pressures are obtained with stronger boilers, higher temperatures by superheating the steam—leading it through pipes surrounded by the hot gases of combustion. That "dries" the steam. With dry steam more heat can be converted into mechanical energy.

Steam engines are getting more water and coal capacity, improved ash pans to reduce cleaning time, automatic lubrication of all wearing parts, and streamlining of all passages from boiler to exhaust to reduce losses in steam pressure. Welds are replacing rivets in boilers to reduce weight and maintenance. Roller bearings are being

added to cut friction, and the old-fashioned piston valve is being replaced with spring-loaded poppet valves, like those on most automobile engines, that offer an efficiency gain of 20 percent at high speed. Manufacturers are putting two additional cylinders on some steam jobs to reduce the strain on connecting rods and bearings and shorten the stroke.

So intent are the older locomotive makers on improving the steam engine that last year they established the Steam Locomotive Research Institute, which has nothing to do but make the product more acceptable to the railroads. It is not mere loose talk that locomotive boiler pressures may be boosted from 300 to 600 or even 800 pounds per square inch in the next few years. Pressures in some types of stationary and marine engines have, of course, gone far beyond that.

# Horsepower Is Heavy

The bane of the steam locomotive is the inherent clumsmess with which it produces power. Producing one horsepower for one hour requires 15 pounds of steam. For 6,000 horsepower that's 90,000 pounds—and for every pound of steam there has to be a pound of water aboard. The water supply must be renewed every few hundred miles.

For that 90,000 pounds of steam some

seven tons of coal must be burned, and the coal supply must be replenished, too. Finally, fully a quarter of the coal goes up the stack in smoke. The reason for that is the forced draft in the stack, induced by a blast of steam from the cylinders to hurry combustion. When coal burns too fast it isn't consumed.

But the steam lovers are even overcoming that. They are pump ing jets of air into the firebox, burning up the residue, and reaping a public-relations profit of smokeless smoke-stacks.

While locomotive designers will argue over what constitutes a good POPULATION DE LOCORIOGIVE DE SOF STEAM SOME DE LOCORIOGIVE DE LOCORIOGICA DE LOCO

THE COVER: A new 2,000-hp. Dieselelectric rolls out of Alco's Schenectady shops as engine is lowered into another. Painting by Lester Fagans.

engine, most of them agree that in the turbine they have a prime mover whose potentialities have barely been scratched. It produces more power from a given amount of coal. The Pennsylvania has a Baldwin turbine geared directly to the wheels. Baldwin now is making a steam turbine-electric locomotive, interposing generators and traction motors between the turbine and the drive wheels for greater power flexibility and more efficient turbine speeds.

What the railroads and the locomotive manufacturers would really like to see is a self-powered locomotive equal to the allelectric engine, which is far and away the most powerful and dependable thing on wheels. But electrification is astronomically costly and is undertaken only in densely settled regions or where electricity is cheap.

# Wanted: A Coal Turbine

Failing that, the railroad men would like to get their hands on a gas-turbine locomotive, preferably operating on coal. That would eliminate boilers and fireboxes and obviate the bugaboo of higher Diesel fuel costs if the nation's petroleum reserves begin to dwindle. The coal turbine would use a fuel that exists in abundance

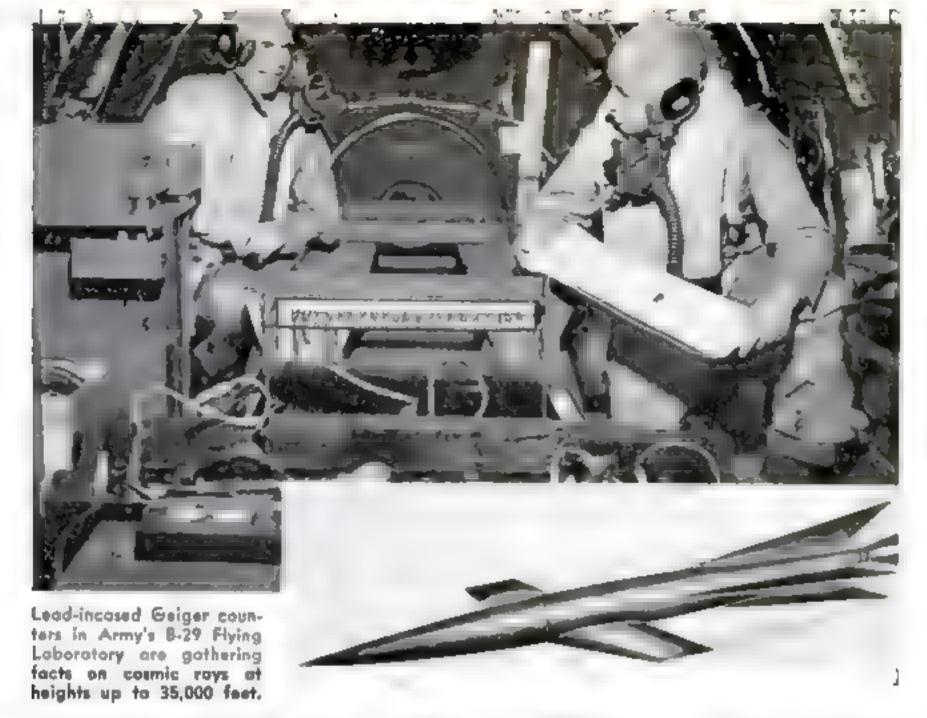

That project is being co-ordinated by the Locomotive Development Committee, under the direction of Dr. John Yellott. No

less than 17 projects are under way at a half-dozen institutions.

And then there is that ultimate source of power to draw the nation's trains that could make the railroads almost independent of either petroleum or coal supplies.

"There is no question in my mind," R. Tom Sawyer, of Alco's research staff, said recently before the American Society of Mechanical Engineers at Charleston, W. Va., "that the atomic-powered locomotive will be used on long, through runs eventually."

The atomic-powered locomotive will be just another version of the old Iron Horse. It probably will use steam.

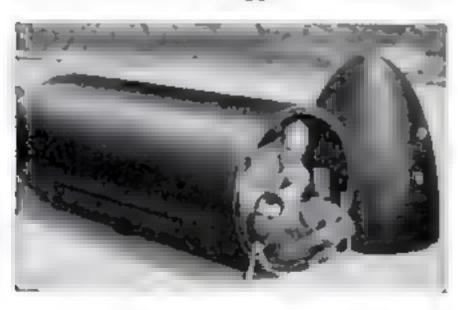

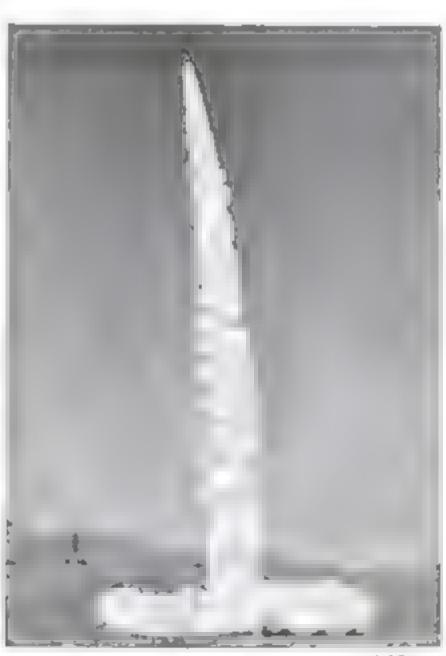

Probing the Upper Air. A number of rocket projectiles like the stub-winged one above (inset) are being built for the Army to gather data on cosmic rays and

other little-known radiations. Carrying instruments to ultra-stratospheric levels, they will supplement findings made by the B-29 Flying Laboratory at lower altitudes.

Guided Missile. "Gapa," a rocket weapon built by Boeing for the Army, is discharged (right) in Utah. Named for "ground-to-air pilotless aircraft," the 10-foot projectile is driven by aerojet units at supersonic speed. It has secret controls designed to track down enemy aircraft.

Saboteur Container. The receptacle below, attached to four parachutes, was used by Germans to drop saboteurs. Ten feet long, it weighs 490 pounds, has a nose of rubberized tubing to ease landings, and carries three men strapped in hammocks.

DCT. 73

# Radar engineer's idea, tried on dog, makes any tub a washer.

PEORGE E. ATKINS is a mechanical engineer in a New York research laboratory who worked on radar during the war. One day, a fellow worker told him about accidentally dropping an automobile horn in a pail of water. It had stirred the water like an egg beater on a bender. Mr. Atkins

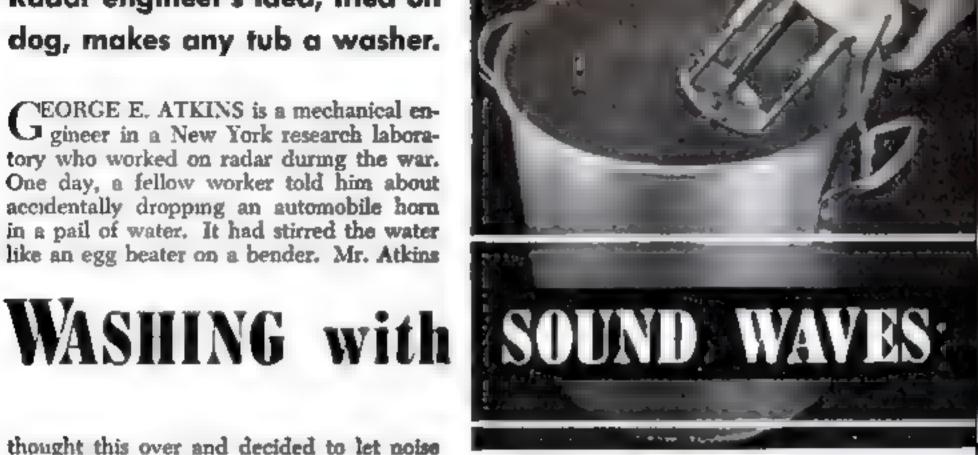

thought this over and decided to let noise do his wife's laundry.

After a year's work, he developed a tiny washing machine that creates sound waves with enough pressure to force the water right through every fiber of the clothes and push out the dirt. The machine weighs only 5% pounds. It has a motor no bigger than a bar of soap. This makes a thin diaphragm vibrate and produce a sound like a vacuum cleaner. Placed in the water, it propagates pressure waves of such force and speed that a fine spray passes continuously through the clothes, reversing the old washing machine method of moving the clothes through the water. More than 12,000 waves per minute race through the clothes so quickly that each one is reflected back and forth several times before the next wave starts.

To test the gentleness and efficiency of the machine, Atkans put his dog in it. The poodle came out clean, happy and minus 12 fleas.

The operating unit, which is 10 inches long, consumes only 35 watts of electric power; rotary or paddle type washing machines use 200 watts or more. Six pounds of clothes placed in a six-gallon bucket of water can be washed in 10 minutes, with even lipstick and perspiration stains removed. The complete unit with a container for the family wash will sell for about \$30.

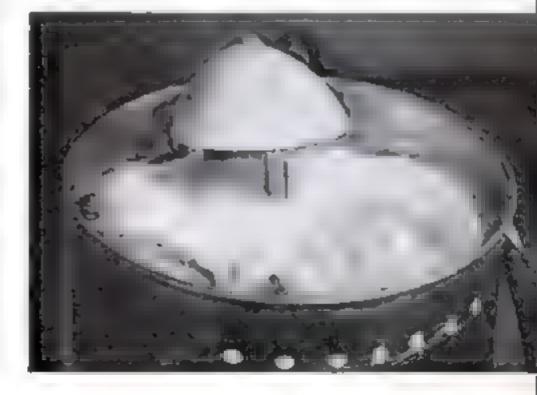

The inventor plans to market a spacesaving automatic washing machine especially suitable for apartment dwellers. Then the housewife will be able to turn on the switch, have a leisurely cup of coffee, and return to a washed, rinsed and dried laundry a quarter of an hour later.

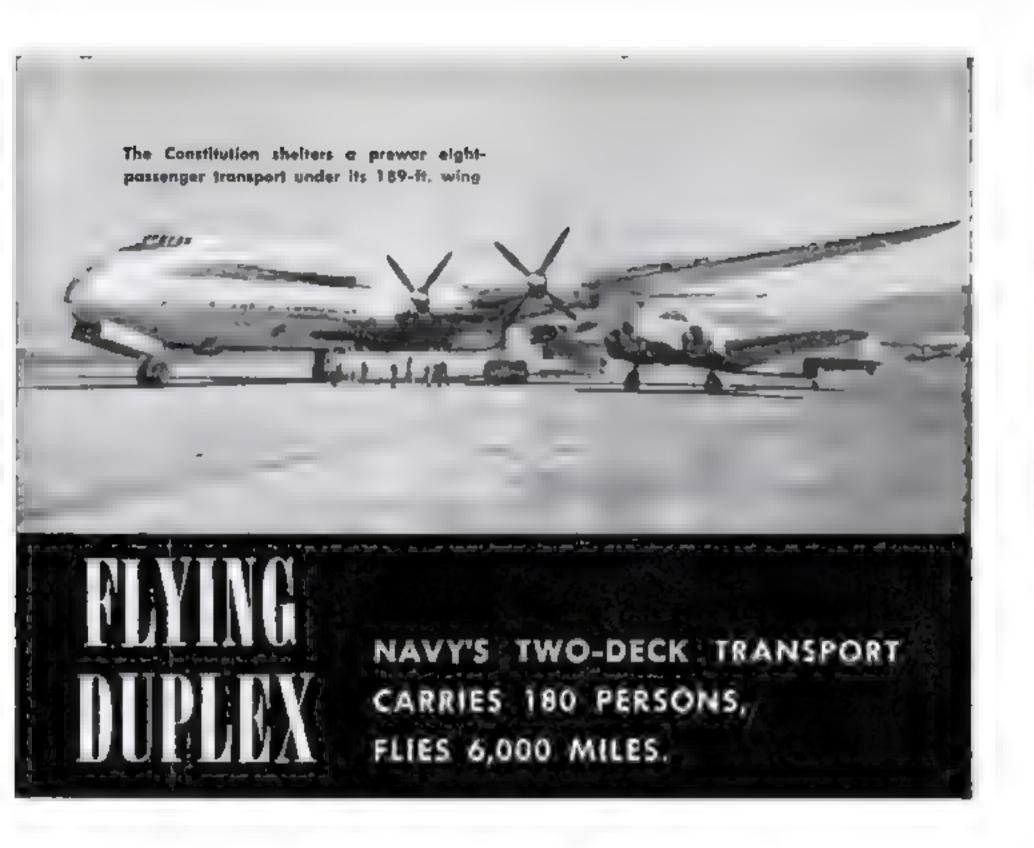

The "vibramatic" unit weight 51/2 pounds and it designed to fit on the edge of a tub or basin.

As shown above, the shaft and diaphragm extend down into the water. The picture below reveals how 240 vibrations a second whip the soapy water into spray, forcing it through the duty clothes.

THE WORLD'S largest land-based transport plane, the Lockheed Constitution, big enough to carry 180 people or 35 tons of cargo 6,000 miles at top speed of 300 m.p.h., will take off on its first flight this month from the factory's field at Burbank, Calif. Designed to meet the Navy's need for a huge plane capable of reaching any island outpost with high-priority loads of men and equipment, the 92-ton Constitution is expected to be making one-stop flights from the West Coast to Japan and China within a year. It will find its way with the most complete navigational radar equipment ever installed in aircraft.

Now equipped with four 3,000-hp. Pratt & Whitney Wasp Major engines, the 156-foot airplane has characteristics that promise even more speed and power. Its high-altitude, high-speed, laminar-flow wing will permit the installation of gas turbines when they become available

Within its figure-eight, "double bubble" fuselage, the Constitution can carry 92 pas-

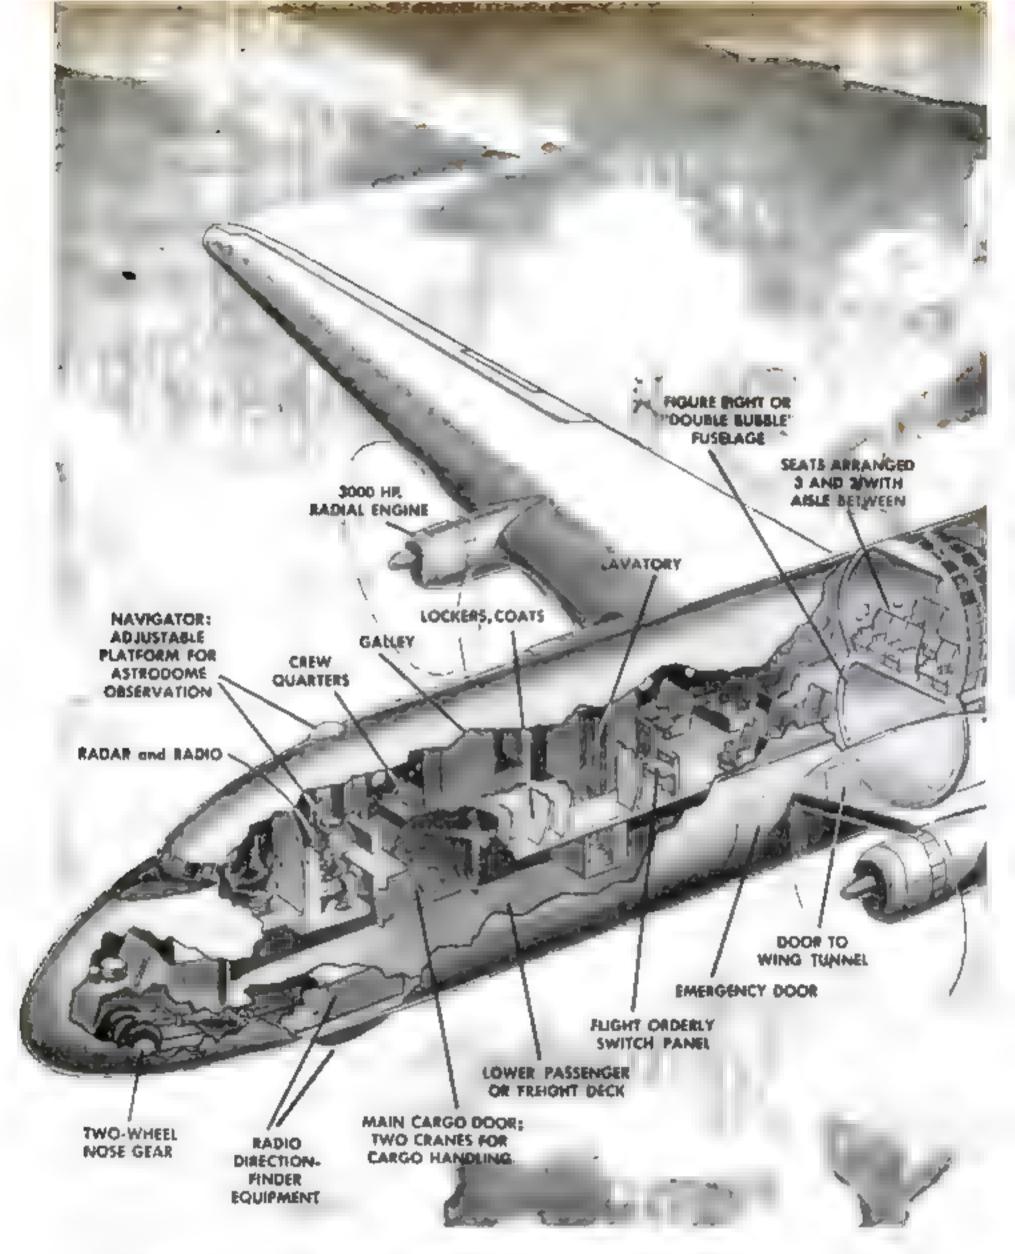

sengers on an upper deck and 76 on a lower, in addition to a crew of 12. Spiral stairways fore and aft connect the decks.

The entire lower deck may be used for cargo. Hoists that can lift five tons at a crack will load and unload the plane at isolated bases through wide doors (106 by 74 inches) in the fuselage.

Two Constitutions have actually been built, at a total cost of \$27,000,000. One will fly while the other undergoes extensive static tests to measure its full strength and potentialities accurately.

While it is estimated that the Constitution, because of its great weight, can operate from only 50 airstrips in the world, it can take off fully loaded in 2,350 feet, land over a 50-foot obstacle and grind to a stop in 2,300 feet. This equals the performance of many smaller transports. On small island fields, reversible inboard props will shorten the landing distance somewhat

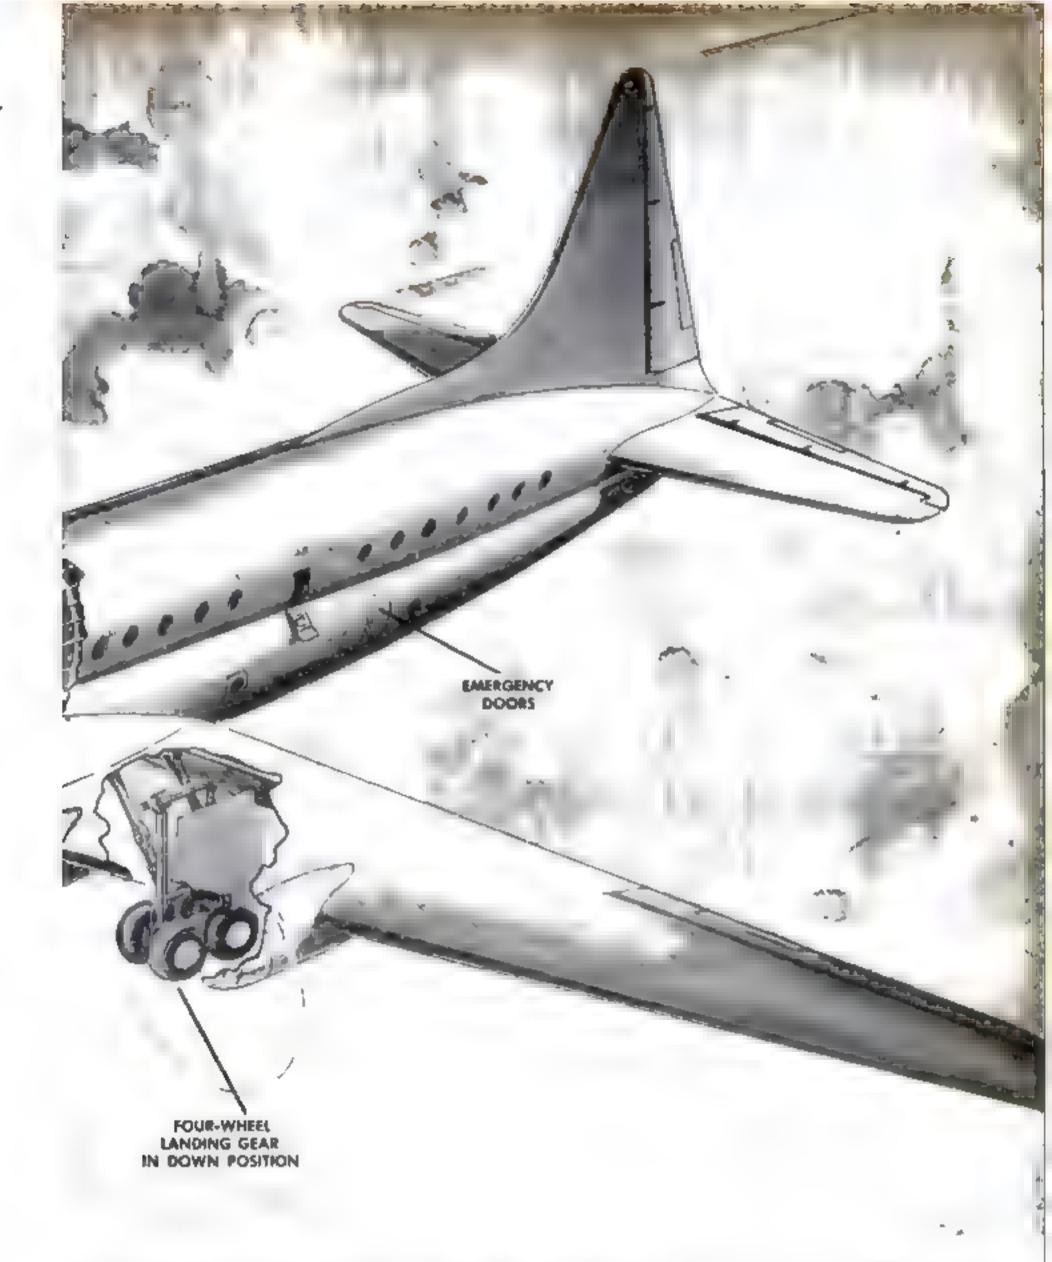

Four wheels on each main gear provide enough footprint area for landings on rough

tropical airstrips, and save a ton of structural weight. The plane also lands without the smoking impact usual with big planes: prerotation devices turn the wheels at landing speed just before they touch the earth.

For safety, the flight engineer will observe all propellers from his station through wideangle lenses fitted into the side walls. He can reach all engines and most of the fittings through man-sized tunnels in the wing if he wants to make inspections or repairs in flight. A one-shot lubrication system makes it possible to pump oil to all four nacelles.

Air bled from the engine turbos and heated to 300 degrees F. keeps all leading edges warm enough to prevent the formation of ice, while electric wires imbedded in the windshields guarantee unobstructed views for the

pilots Some of the edge-heating air (PSM, July '46, p. 112), moving through a pair of heat exchangers, warms the cabin

Three hundred hot meals can be served aboard on long flights. Immersion heaters in tanks by the stairwell and under the wash basins in the rest room provide hot water for cooking, bathing and shaving. Garbage, stowed in tin cans, will be tossed overboard

when the plane is flying at low altitudes over open ocean

Enough gasoline to fly 6.000 miles—9,990 gallons—is carried in four integral wing tanks, sealed tight with putty made from crude rubber. So fueled, the Constitution can ferry important cargoes from New York to the Panama Canal in eight hours, to Dakar in West Africa in 13 hours.

# Rocket Camera to Shoot Sun

V-2s will carry spectrograph outside filtering blanket of atmosphere.

# By MARTIN MANN

THAT long-standing riddle—what makes the sun tick—may soon be solved. Photographs now being made 100 miles above the earth by a V-2 rocket camera are expected to record ultraviolet rays so short that they cannot penetrate the atmosphere. From them, scientists hope to learn more about the source of all our energy and many of our troubles.

If you ever listened to a European broadcast suddenly fade into a bedlam of static, you have heard one effect of the sun. Huge oceans of hot gases on the surface of the sun jam radio communications. They also affect the weather, but the relationship between these sunspots and disturbances in our atmosphere is not understood. Supports have been blamed for booms and wists in business. And if enough could be learned about solar energy, we much be freed from worry about coal, oil, or tranium

The few strips of film being exposed this year are not likely to clear up everything, but they are expected to show the first true pictures of the spectrum of the sun. And that may be the key—as new spectra frequently have been in the past—to discoveries of startling importance. The instrument made for this Nuvy-sponsored research, the spectro-

graph, is a prism placed inside a camera, between the lens and the film. The prism divides the light from the lens into its component wave lengths, or colors, so that the film records a broad spectrum band (the rainbow) composed of lines representing each wave length.

Since every substance has its own set of characteristic spectrum lines, which change with conditions, much information about the sun can be obtained from study of its spectrum record, or spectrogram. It is through such a study that the supervisors of the project, Drs. James S. Van Allen and John J. Hopfield, of Johns Hopkins University's Applied Physics Laboratory, hope to fill the existing gaps in our knowledge. The sun.

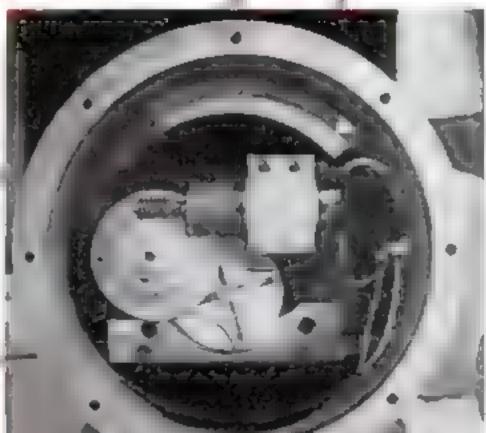

cord light waves a short as 1,200 angstrom units (about 5 millionths of an inch). Only incomplete analyses of sunlight can be made on the ground, for the miles of air between the sun and the spectrograph lens filter out nearly all light below 3,000 angstroms. Previous attempts to climb above the filtering effect of the atmosphere by futting spectrographs in balloon, were not especially successful because the balloons did not rise more than 27 miles. Now the rocket can take a spectrograph up 100 miles

A ride in a V-2 However, is not unbroned

The rotor that holds the spectrograph's film strips is slipped into its perfective, lightproof shell. Inside the square opening is the lithium fluoride prism that separates sunlight into component colors.

This good and cam assembly moves the figh-holding rater so that a new strip of film is expessed every 20 seconds. The slotted cam wheel in the center of the photo is the heart of the intermitted movement.

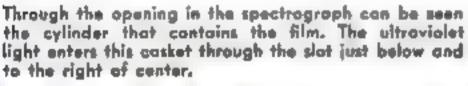

Oper-all view of the spectrograph. The ultraviolet light enters the instrument through the long tube, which is placed in the very nose of the racket.

jaunt. The rocket smashes into the ground at about 3,600 m.p.h. with a deceleration rate equivalent to 20,000 tues the force of gravity-at the instant impact the tiny film strips, ordinarily reighing only a fraction of an ounce, with an equivalent weight of 30 lbs. No spectrograph could be constructed to survive that crash. But a film holder might. Making the holder sturdy enough to protect the spectrogram in the impact, therefore, became the major problem of the designers, John Forrest, Harold Straat, Ralph Dakin, and Walter Guenther of the Bausch and Lomb Optical Company, Rochester, N. Y. The result was a two-piece, cylindrical steel casket, called

a cassette, that is practically indestructible. The outer shell of the casket is an 11inch hollow steel cylinder with a lengthwise

The atmosphere blacks sunrays shorter than 3,000 angstroms in wave length. The racket comera, climbing above this filter of air, is expected to catch light never recorded before.

The solid steel film holder, shown obove, is strong enough to survive the final 3,600-m.p.h. crash when the V-2 bits the earth with a force 20,000 times the pull of gravity. The 25-lb. cassette, containing the film holder, will then weigh holf a million pounds.

Dr. John J. Hopfield, of Johns Hopkins, a supervisor of the rocket-camera project, fits the film holder into the spectrograph.

slot that admits the broad spectrum band. Into this shell fits the motor-driven film holder, a solid steel rotor with a number of flattened faces bearing guides to hold the strips of film. One portion of the cylindrical surface remains curved and is coated with black velvet. This curved section covers the slot in the shell before and after the film has been exposed, making a light-tight seal—like the slide in the film holder of an ordinary plate-back camera.

## Acceleration a Hazard

The casket is fastened inside the body of the spectrograph, which is of simple design but extremely rugged construction. For even though the spectrograph may be destroyed in the final crash, it must withstand the terrific forces on the way up, when the rocket leaps to a speed of 3,000 m p.h. within a few seconds. Lenses and prisms are made of synthetic lithium fluoride, which transmits ultraviolet light of wave lengths too short to pass through glass or even quartz. The objective lens, set in the tip of the rocket nose, is a hemisphere, giving an extremely wide angle through which light can be collected. With this unusually wide angle lens the spectrograph catches sunlight even though the rocket may not point directly at the sun.

To secure a number of spectrograms made at different altitudes, an electric motor turns the film-holding rotor, exposing a new strip of film every 20 seconds. This intermittent movement of the rotor is obtained with a cam wheel called a Geneva wheel, which acts somewhat like the mechanism in a motion picture camera.

As the rocket soars out of the atmosphere a microswitch, preset on the ground, starts the motor, bringing the first strip of film into position at the slot. When the last strip has been exposed and the black velvet again covers the slot, a bolt automatically locks the rotor and shell together.

Special film for use in the V-2 spectrograph was made by the Eastman Kodak Company. A fluorescent coating that glows visibly when struck by ultraviolet light helps record the very short wave lengths, since the gelatine in photographic emulsions does not transmit light below 2,000 angstroms.

So far only one V-2 spectrograph has been built, future plans depending on the results obtained from the present experiments. If there is a second model, the designers plan to use a mirror, controlled by a photoelectric cell and moved by a servomotor, to reflect sunrays directly to the spectrograph.

# Saving the Instruments

Modification of the rocket itself—to reduce the speed of fall and in that way minimize damage to component parts and instruments has also been proposed. To save an instrument in the nose of the rocket, Dr. Hopfield suggests a time-fused explosive charge to blow away the head after the rocket reaches peak altitude. Tumbling end over end, the freed nose would drop more slowly than the rocket, which, stabilized by its fins, falls head first. Another method, also employing an explosive charge, would disconnect one fin, causing the entire rocket to tumble and fall more slowly. Attaching parachutes to the instruments, which would automatically be jettisoned after the highest altitude was reached, is another possibility.

Even these precautions may not work. The crashing rocket digs such a deep crater that recovery of any surviving instrument from the rubble of steel, earth and rocks can be very difficult. And if the hole fills with water, as one did, there would be small chance of fishing out a particular recording device.

Allowing parts of a rocket to fall separately also has its drawbacks. Too small for radar tracking, they could be lost forever in the vast desert. The record flight of the eighth V-2 is an example. Two weeks afterward, troops were still seeking records of the trip.

BIGGEST BOMBER. The Consolidated X8-36, world's largest land-based airplane, is shown above with a B-29 Superfortress, which used to be a monster in its own right. The war-born giant mode its first test flight last August and, in the Army phrose, "exceeded expectations." So big that few present airports can handle it, the X8-36 is powered by six 3,000-hp. Pratt & Whitney pusher-type engines. It is 163 feet long, has a wing span of 230 feet and

weight 160 tons. Its tail is as tall as a five-story building, and its main tires are almost nine feet high. It is designed to carry a crew of 15 and 30 tons of bambs 10,000 miles. Consolidated has an AAF contract for a fleet of B-36s, and plans a 200-passenger air-line version.

GLASS HELMET. Made of laminated glass and styrene plastic, this bulging aviation helmet weighs less than two pounds, it has built-in radio head-phones and a spange-rubber interior for the wearer's comfort, and protects an airman's head by equalizing distribution of impact forces. Designed by the Aero Medical Laboratories, University of Southern Colifornia, and Northrap Aircraft, it was first used in tests of the XB-35 flying wing.

ROCKET BOME'S FORERUNNER. Built to test the efficiency of flying-wing design for a rocket bomb the midget mon-carrying Northrop glider shown below is now used for instruction. With a wing span of less than 30 feet, the tiny craft is capable of slow rolls in free flight after being towed aloft.

# WHAT'S NEW IN AVIATION

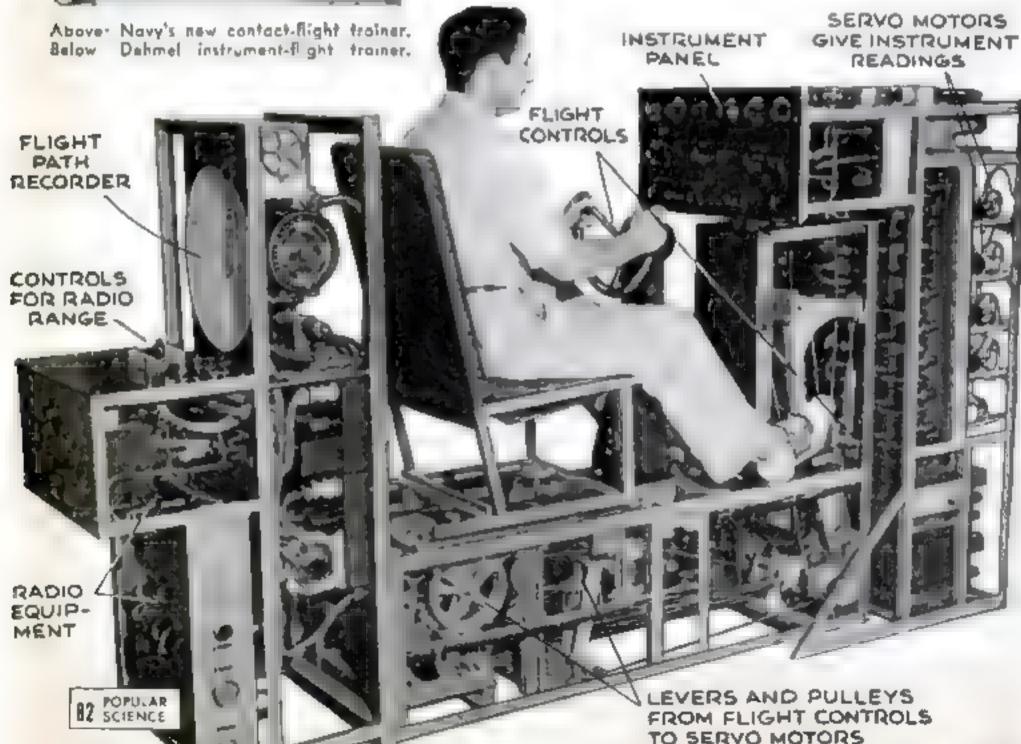

# Machines to

New electronic trainers and tiny flight controls for switches make flying easier.

PILOTS now can learn how to fly loops entirely by instrument in an earth-bound cockpit that doesn't budge an inch. The new electronic Delinel thank trainer, produced by Curtiss-Wright can imitate—on instruments—the flying characteristics of anything from a small personal plane to a four-engined transport

In another recently developed electronic trainer a cockpit on wheels equipped with a periscope, the Navy is teaching student pilots how to strafe, bomb and launch rockets in an F6F. The pilot gazes through the periscope at a relief map on the enling and feels that he is looking at the earth from a moving plane. As he "dives," the periscope moves

# Help Pilots

closer to the ceiling; as he "climbs," it retreats; when he "banks," its reflector cants realistically.

A third new mechanical aid for pilots, produced by the Douglas Arreraft Company, is a set of baby flight controls that are being used in place of switches in the cockpit of a still-secret jet plane. Psychologists say that the small-scale controls will simplify the highly demanding job of flying the plane, improve its pilot's reaction time.

As a student in the Dehmel instrument trainer goes through the motions of flying-

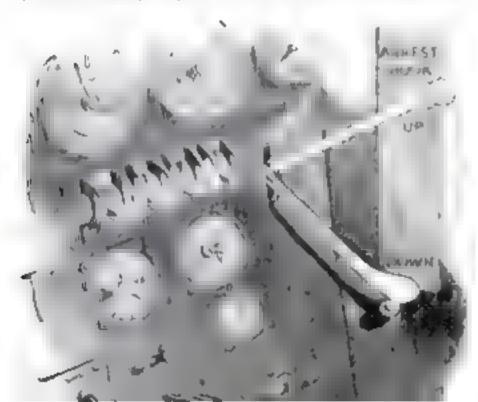

flicking switches, moving levers—current dividers, called "contour potentiometers," send varying voltages to servomotors. The servos then change the instrument readings as they would change in actual flight.

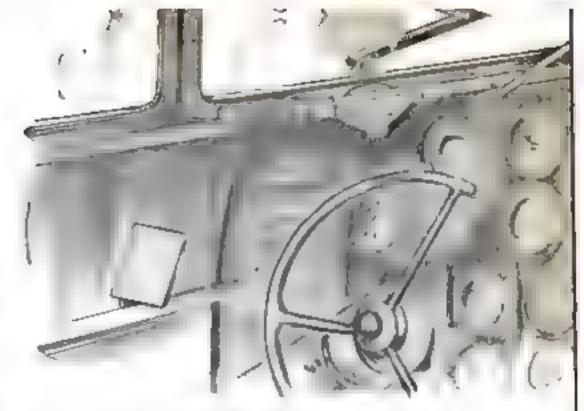

The radio system of this trainer is as complete as an air liner's. It can duplicate any radio range or airport beacon; it even imitates the CAA's blind-landing system.

The moving pencil of a flight-path recorder, mounted behind the trainer, tracks the "plane," enables the student to check his mistakes after each session. If a 360-degree turn is not constant, for example, the track will look like a badly warped egg instead of a perfect circle.

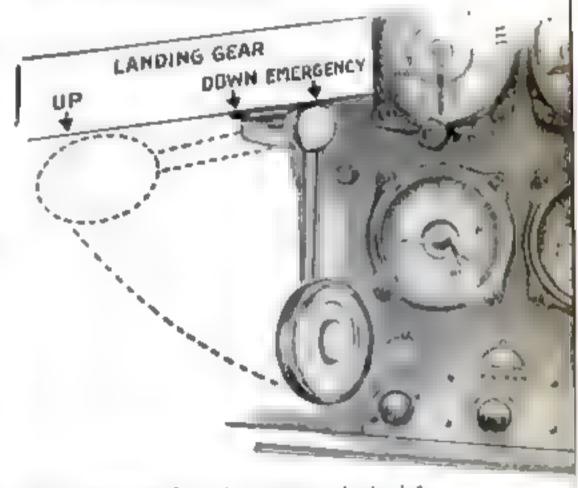

Recorded engine noises are piped into both the Dehmel and Navy trainers to help pilots learn to synchronize engines by ear.

For a secret jet plane obviously intended to land on a carrier, Douglas engineers designed a miniature arresting hook in place of the switch the pilot normally flips to let his toil gear down.

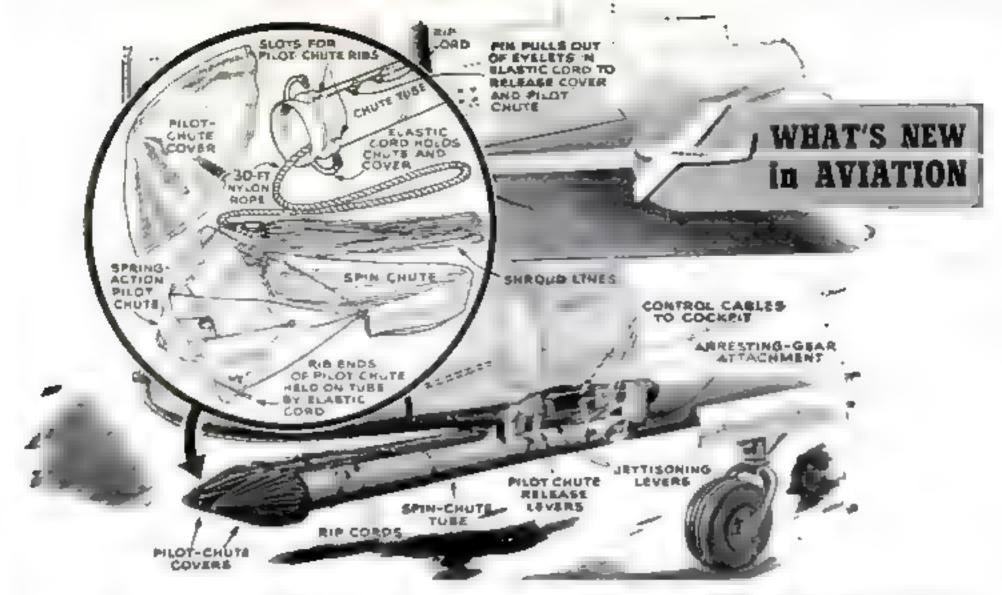

Among the Dauglas taylike flight controls that enable a pilot to recognize and reach more quickly for the switch he wants is a small, hand-operated "foot" pedal for braking the jet plane's landing roll.

The landing-gear lever is a strut and wheel four inches lang. Grouped functionally, the Dauglas flight-control switches operate freely when the pilot is wearing his parachute and safety belt.

The wing-flap lever, half an inch wide and three inches long, has a contour very similar to that of the actual flap. The movement of each small control parallels that of its full-size counterpart.

# Parachutes for a Test Plane

SPIN tests on untried airplanes have always been perilous. When Martin prepared recently to spin-test its new BTM Mauler it went all out to provide safety for the test fliers and the costly prototype. It had two

special spin parachutes designed. Each was tested for 9,000 pounds. These were placed in tubes under the fuselage (above). Had the Mauler gone into an unbreakable spin—which it didn't—the pilot could have saved himself and plane by releasing the 'chutes and checking the fall

# **Red Light on Stalls**

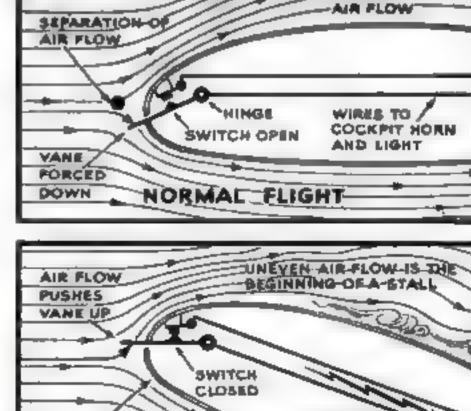

CAA RECORDS ascribe more than half of the deaths in private fiving to the pilots' failure to recognize an approaching stall. Hope for reducing the rate of such fatalities has in the Safety Flight Company's new "Stall Warning Indicator." This CAA-approved device (below) is mounted on the leading edge of a plane's wing (see diagrams) and when the stall point nears it flashes a light and sounds a horn in the cockpit to alert the negligent flier.

# Push-Parking button Parking

PRESS a button and park your carl The Park-O-Mat automatically places an auto in any desired stall of a garage. With it, more cars can be parked in less space in less time by fewer attendants.

At the garage entrance arms grip the front and rear bumpers and slide the car to an elevator. This stops at the proper floor; arms slide the car into the stall. Another button reverses the process, bringing the car to the entrance in less than a minute. Since the car does not run under its own power, the owner can look it when he leaves

Arms automatically roll car onto the transfer table, which will carry it to empty stall.

After leaving car, positioning device returns to entrance where operator stands at contrals

You visit your dentist and he thinks there may be something wrong with that bicuspid—better take a picture. He puts the X-ray film carefully into place and then he tells you to hold it there. It is the one operation he cannot perform for you. The rays from his low-power machine, harmless to patients who undergo them only at long intervals, would add up, and sooner or later he would lose his fingers—or worse.

Before 1895, when Roentgen discovered the X-ray, sunburn was the only harm done to people by radiation. But now atomic bombs have released vast invisible clouds of lethal radioactivity, and lesser but dangerous amounts of radioactivity will become commonplace as atomic energy is put to work.

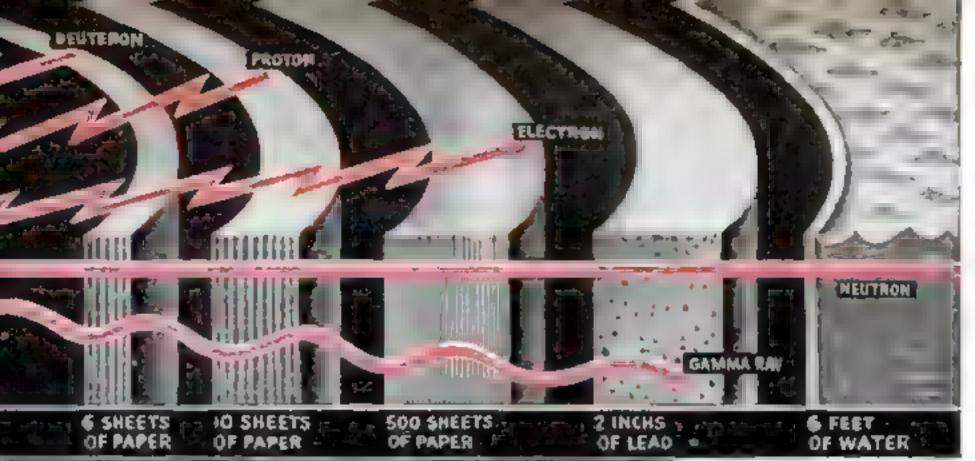

For protection against this, the weirdest danger in the world, men must depend entirely on advance precautions. One can get a fatal dose, either cumulatively over years or in a millionth of a second, and not know anything has happened to him until too late. Man's inventiveness, in short, has far outrun his built-in safety equipment—except

for the protection provided by his brain.

Radiation as such is nothing to be afraid of. The eye sees by electromagnetic radiation. Solar radiation warms and feeds us. Radio waves pass through our bodies and we never know it. Even the centimeter waves of radar are so long, compared to the cells and atoms of the body, that they cannot harm us.

It is artificial radiators which emit subatomic particles or waves that cause trouble.
These include naturally radioactive substances like radium that become dangerous
—and useful—when concentrated from ores,
and man-made isotopes of familiar elements.
Another category includes X-ray generators
and all the various atom-bombarding and
fissioning devices like the cyclotron, the
uranium pile and the atom bomb. Finally,
we must reckon with everything that has
been rendered radioactive by exposure to
such devices.

The danger however, can be measured. The unit of X-radiation is the roentgen (r), and the human body should not be subjected to more than 0.1 r a day as a regular

Drawing above shows what it takes to stop various otomic particles and rays.

In removing radioactive material from pile after neutron bombardment (left), corrier block is pulled into lead shield to protect workers. Meanwhile, pile halts. Below, defined radiation beam, issuing from hale (No. 20) in shield of atomic pile, is halted by lead bricks in foreground after passing experimental device in center.

WORKING WITH RADIOACTIVE MATERIAL FROM ATOMIC PICE, OAK RIDGE, TENN.

thing. This tolerance dose allows a sizable safety margin but it is better not to experiment with an overdose

Measurement reveals the danger, Protection may be secured in three ways: distance, direction and shielding

Distance is effective since intensity normally falls off according to the inverse square law—double the distance from the source and you get only one-fourth the intensity. Radiation sources should, therefore, be as far as possible from occupied rooms in the same building.

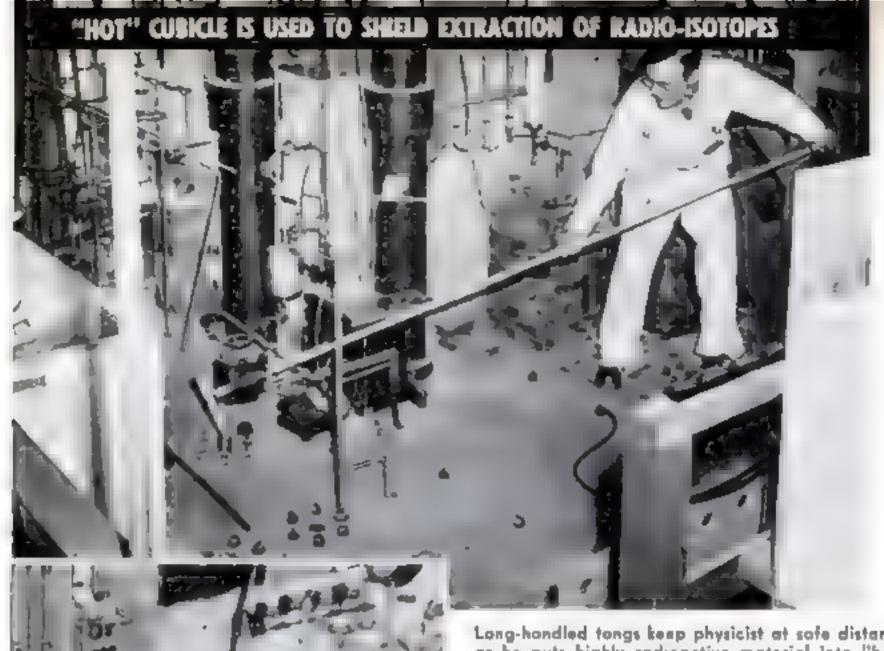

Directive protection depends on beaming the radiation. Precautions must still be taken against the scattering of the beam when it strikes an obstacle, such as a patient—or even air.

Shielding consists of interposing materials between the equipment and the

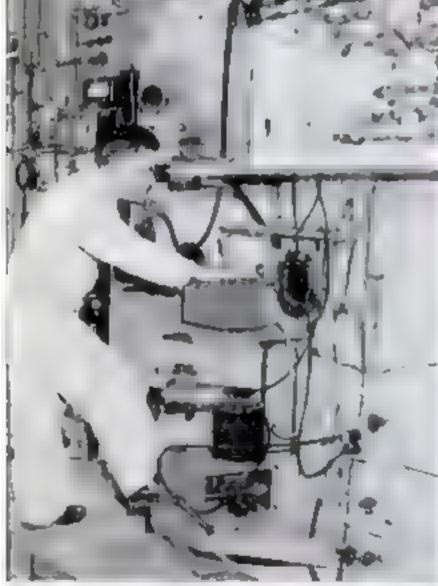

operators. Additional partial protection is given by rubber-lead aprons and gloves. Shielding may also be built into the radiator itself, as in the modern X-ray tube.

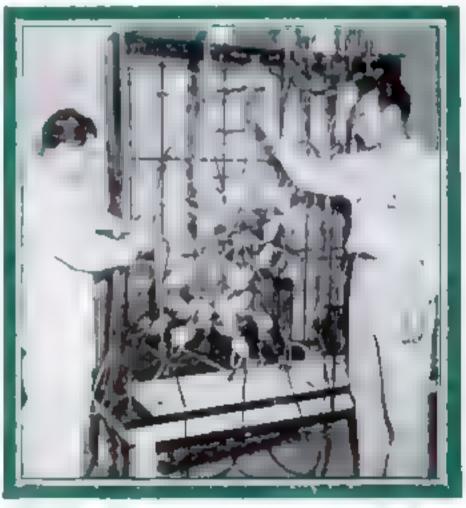

Despite these safeguards, operators and innocent bystanders are going to absorb some radiation. No important source is

Long-handled tangs keep physicist at safe distance as he puts highly radioactive material into "hot" cubicle, where it will drop down to processing units.

Periscope is used for safe observation of separation of fission elements from pile uranium, taking place in cubicle behind two-foot concrete wall.

Workers wear film budge and pencil-like radiation meters on shirt to record personal exposure as they test apparatus in cubicle that is not in use.

weak enough to be wholly harmless. The New York City Board of Health recently banned baby X-ray outfits used in fitting shoes.

In practice, a powerful source with builtin protection is likely to be safer than a weak one where safety depends upon skillful use. A dental X-ray operator will receive his daily dose of 0.1 r in eight mouth examinations—even if he keeps out of the beam. If he doesn't, he will get more than the tolerance dose. Fluoroscopic units, where the picture is thrown directly on a screen, can also be dangerous. The operator is liable to turn up the current to get a brighter image, and overexpose himself. Mobile X-ray equipment in hospitals and factories likewise requires fast work and, sometimes,

rotation of operators.

X-ray penetration varies with the tube voltage. The higher the voltage, the more necessary—and more difficult—it is to confine the radiation by fixed shielding. Present-day medical and industrial machines range from 10,000 to 2,000,000 volts. Lead is an effective barrier at low and moderate voltages. The entire room must be covered except for the lead-glass observation window, sometimes backed by water or a lead solution. Dangerous radiation may escape through the smallest leaks, so nails must have lead-covered heads and sheeting must be overlapped at the joints.

Lead is easy to work, but expensive when, for example, a half-inch thickness is required to reduce the radiation from a 400,-000-volt X-ray unit to the tolerance level at 13 feet. Consequently, at the higher voltages, building materials are generally used, although sometimes 20 times the ordinary thickness is required. Concrete becomes more effective, however, as the voltage goes up: at 1,000,000 volts the ratio is little over

six to one.

The 1,000,000-volt X-ray installation at Memorial Hospital in New York has concrete walls 15 to 36 inches thick, a 36-inch floor and an 18-inch ceiling. The lead-covered door is additionally protected by a 15-inch baffle wall. This room is well-shielded; at no point outside is the radiation greater than 1/10 of the accepted maximum, and at the operator's control station, behind a water tank and window of leaded glass, it is only 1/25.

A million volts are often used in industrial work, sometimes without adequate protection. With a large industrial machine on full power and nothing in front of the tube, the radiation at 100 feet may greatly exceed the tolerance level. It may pass through the building will and expose people outside or even in another building. To add to the danger, typical targets of a high-voltage industrial unit, such as armor plate, require long exposures. The beam is best directed toward the ground.

In the betatron the electrons are whirled through thousands of revolutions and then loosed at the target like a stone from a sling. Sharply beamed, the betatron is not yet a radiation headache, since the few in existence are in highly skilled hands. But Dr. G. Failla, one of our foremost radiologists, recommends that the safety limit for betatron workers be reduced fivefold to 0.02 r per day.

Shielding a cyclotron is another problem entirely. The neutrons it emits behave differently from X-rays and lead and concrete are less effective shields. In lead, the neutrons bounce off the heavier nuclei and continue on through the atom. Neutrons will,

With this remote manipulative device, workers can open battle of radioactive material and draw a sample while staying outside danger zone. Battle is buried in heavy lead block with only top sticking out. Mirror shows what's happening behind shield.

Lead-brick wall guards physicist as he evaporates a purified sample of a radio-sotope in "semihat" lab, Long tongs are used to handle beaker.

however, give up most of their energy to a bydrogen nucleus, which weighs almost exactly the same. The action is like that of two billiard balls. Paraffin, sawdust, and water, all hydrogen-neh, are most effective.

The 60-inch Berkeley evelotron is almost enclosed by five-foot water tanks, and the operators stay behind an 18-inch concrete wall. Since the evelotron gives off other radiations beside neutrons, lead is also used. Water tanks 25 feet thick may shield the new 184-meh evelotron which will be isolated on a lonely hill, the control room probably behind 100 feet of earth.

The atomic power plants are shielded mainly by "very thick" walls of concrete with steel doors. All operations are handled by remote control. The principal radiation from an atomic pile is neutronic, but alpha and beta particles and gamma rays are also present. The splendid safety record of the Manhattan Project shows what can be done

in protecting personnel

But accidents will happen. Even at safety-conscious Massachusetts General Hospital, six qualified experts received doses of 1,000 to 2,000 r during a few seconds exposure last year while testing a 1,200-kilovolt electrostatic generator. This machine emitted an electron beam that the men carefully avoided, but collision with air particles scattered enough electrons to produce severe burns. And at Los Alamos, Dr. Louis Slotin, a well-known atomic scientist. was killed recently when enough fissionable material was accidentally brought together to cause a flash of gamma rays and neutrons.

Slotin knocked the equipment apart after the fatal slip occurred and seven other workers survived.

If radiation is released for military purposes, the possibility of protection is dubious indeed. Bikini taught us that the sole protection from radiation when an atomic bomb explodes is distance and plenty of it. The flash of lethal radiation, principally gamma rays and neutrons, lasts only a millionth of a second, but it is likely to finish everyone within range, even if they survive temporarily. At the same time, fission products are flung in all directions.

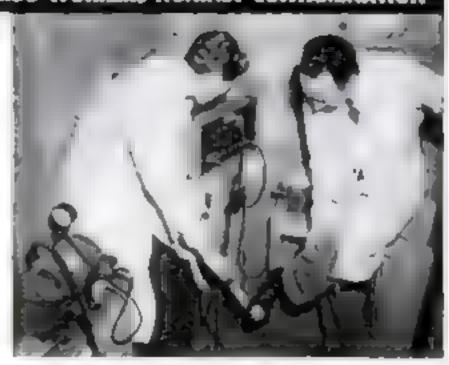

Uranium fission products include isotopes of strontium, zirconium, tellurium, molybdenum, and ruthennum. Where these are deposited the area will remain radioactive from 32 days to five years. The same applies to large masses of water or steel ("hot" ships or buildings) in which radioactivity may have been induced. Moreover, poisonous particles may be inhaled and fish caught in

radioactive water may be deadly.

The only safeguard for atomic-bomb radiation is political rather than technological. But for peaceful uses radiation can be controlled like any force of nature. Unquestionably atomic power has sharply increased the risks-but also the blessings, actual and potential. If nobody was endangered by radiation 50 years ago, neither could anyone detect a flaw in a steel rail nor have a thyroid cancer treated with radio-iodine. For better or worse we are living in the atomic age, which is also the age of radiation. What we make of it is up to us.

Dangerously radioactive materials are moved from lab to lab in special load containers. A probe counter, at right, checks possible radiation leaks.

All lab workers undergo frequent checks for possible radioactive contamination. They wear washable clothing and special shoes marked by painted toes.

CAPS AND SLEEVES FOR TOOLS. A tough protective coating can be applied to tools, machine parts, tubing or wires with a new process developed by the chemical department of General Electric. Plastic material, available in caps or sleeves, is immersed for two to four hours in a ditating solution that expands the material as much as 50 percent. Then the sleeve is put in position and allowed

to dry, which shrinks it to less than original size. As an insulating grip for wrenches and pliers (above, left) the material also protects the tools from rust or corrosion. Fitted over a threaded part (upper right), it shields the threads from damage. The sleeves (lower right) are shipped dry and tests have indicated that the coating will keep indefinitely without splitting and crocking.

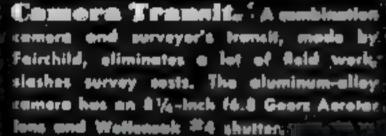

LIGHTWEIGHT MICROPHONE. Tenite plastic, a cellulose acetate butyrate product, encases a crystal microphone designed as a hand or table model for home recordings and public-address systems.

SCREW-HOLDING SCREWDRIVER. The double blade of the screwdriver shown below can be separated inside a screw head to hold it for setting. Handle and button that operate blade are Tenite.

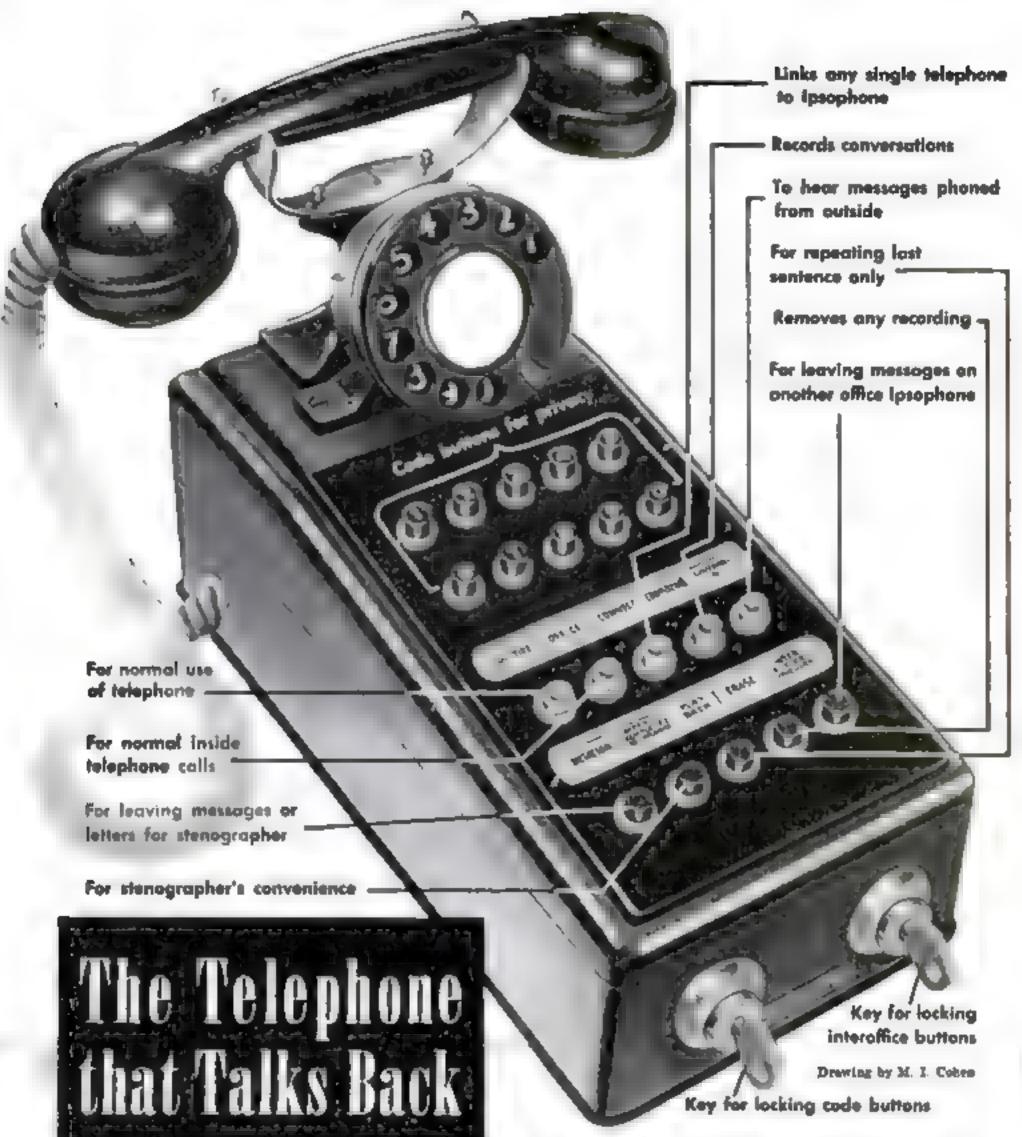

Lamp that Talks. The gap between radar and walkie-talkie has been bridged by Westinghouse's new cesium-vapor "talking lamp." The lamp picks up words from a mike (above) and transmits them secretly by infrared rays to a parabolic reflector. This receiver unscrambles the rays and reconverts them into clearly audible words at conversational speed.

Ever-Clear Windshields. Nesa, a new method in which glass gets a transparent coat which can carry electric current to all parts of a windshield, spells an end to may and fogging (below, right). Pittsburgh Glass developed it.

THIS is the versatile Ipsophone. It will automatically answer the telephone, tell the caller to "go ahead," and then record his conversation. The instrument, complex in design but based on a simple principle, combines a telephone and a steel-wire recorder. It can be hooked up to any telephone line.

An amazing feature of Ipsophone is that it will divulge recorded messages over the telephone if given a prearranged code number. To get this service, the user opens the lock on the left at the bottom of the receiver box, punches the desired code number on the top two rows of numbered buttons, and relocks the lock again for secrecy. In calling the robot to ask for messages recorded during an absence, the user says "Hello" twice in a distinct voice and gives the secret code number. The "telephonograph" then repeats its stored conversation, erasing it afterward if told to. Werkzeugmaschinenfabrik Oerlikon, a Swiss firm, developed the Ipsophone. It is not yet available in the United States.

PSM photos by HUBERT LUCKETT

HANDMADE "thermal smifers," which can seent a rising current of warm air four seconds ahead of a glider's wing and guide the pilot to it, nosed through storm clouds over central Florida last summer, hunting for information vital to everybody who flies. The "smiffers" rode rough skies as part of an all-out effort by the AAF and Weather Bureau to find out exactly what goes on inside a thunderhead. Rugged P-61s joined the search, carrying precision-made meteorological and aircraft instruments, VHF radio, radar, movie and aerial cameras into ice, snow, and hail miles above the baking earth.

Safe flying in the dirtiest weather will come sooner because of this clinical study of storms, which went on from June 28 to September 30 in and over a perspiring sector about 20 miles southeast of Orlando and will be resumed next April in Ohio.

The doctors who took the pulse, listened to the breathing, checked the blood pressure, and photographed the insides of sullen

thunderheads were mostly volunteers. In addition to the P-61 pilots they included glider pilots of the Soaring Society of America, Weather Bureau technicians, instrument experts from the National Advisory Committee for Aeronautics, and University of Chicago scientists. By April the Navy expects to join the probe with its Helleut drones, engaged this year at Bikini.

A diamond-shaped area of some 60 square miles was roughly staked off in the scrub pines, swamps, and sand around St. Cloud, and dotted with every available weather instrument that would be useful. With far-sighted radar, ground-based west of Orlando, developing storms were spotted and tracked. When it became certain that the mushrooming cumuli would pass through the open-air consulting room prepared for them, the P-61s were sent up from the oven-hot runways of Pine Castle Army Air Base to batter their way through the churning cloud masses.

Instruments in the planes automatically

recorded the buffeting turbulence, mile-aminute updrafts, temperature ranges, pressures, and relative humidity they encountered at 200 m.p.h. Gliders were towed into position to rise into the thunderclouds on wind-current elevators and make similar recordings at a more lessurely pace. Selfoperated movie cameras filmed the brief life stories of storms, took thousands of pictures of radar scopes and instrument dials.

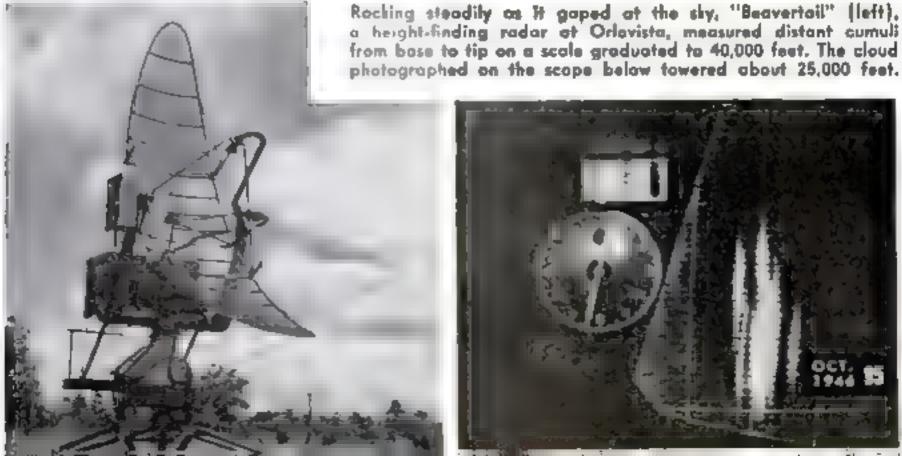

Nobody knows yet precisely what causes a thunderstorm and what happens in its boiling interior. There is no way of telling bad clouds from worse. But when the miles of movies and graphs made in Florida and scheduled to be made in Ohio have been analyzed, man will know much more about the kinds of planes, instruments, and techniques he needs in order to fly safely through the most dangerous atmospheric conditions.

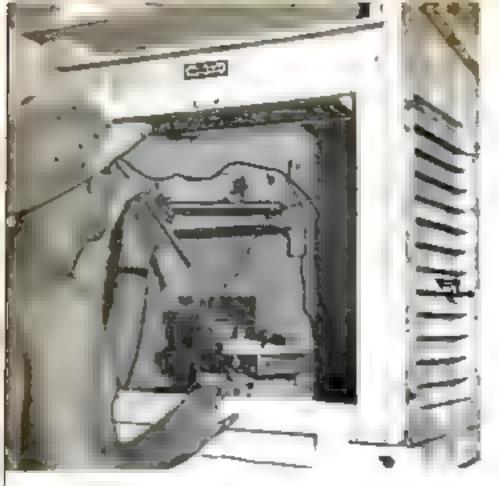

Two-man training gliders, lent by the Navy, were loaded for thunderstorm probing with instruments they had never carried before, In the co-pilat's place were an eight-channel VHF radio, recording comeros, and a baragraph. Each instrument panel had II dials instead of the usual six.

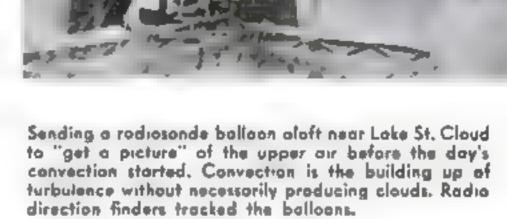

There were 55 of these Weather Bureau huts scattered at one-mile intervals over the test orea. When a thunderstorm crossed this sector their instruments automatically recorded all changes in pressure, temperature, humidity, and wind that took place beneath it.

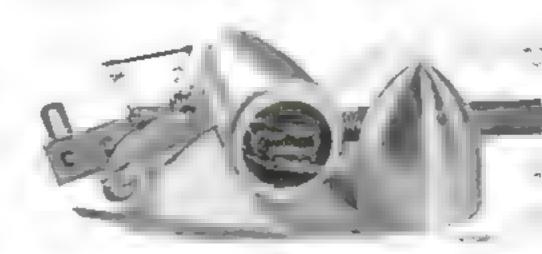

A "thermal sniffer" (below), used for the first time on the thunderstorm project in Florida, is a ring of 100 delicate thermocouples girdling a fat bolso-wood container with a care of ice and water in a metal cylinder. Circular aluminum shield protects the thermocouples from the sun.

Two "sniffers" were mounted 50 feet apart on the wing tips of a glider. A string galvanameter in the cockpit measured the temperature gradient between them, recorded

changes as minute as 1/250 of a degree Centigrade. Dr. August Raspet, research director of the Sooring Society of America, invented and built this warm-air sleuth.

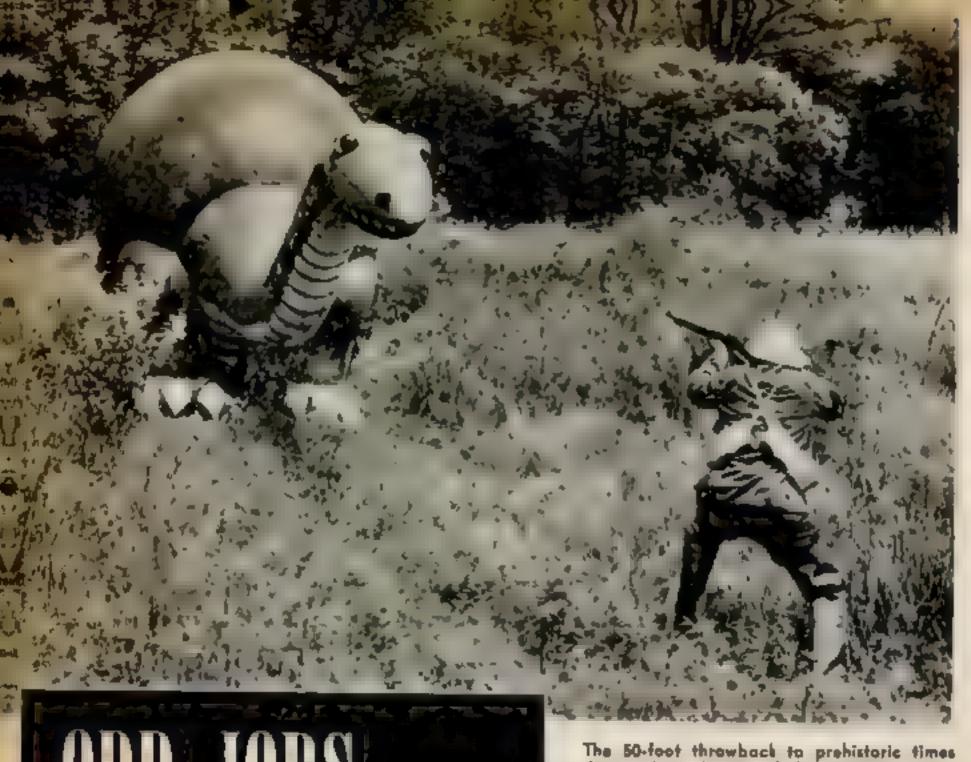

A sensitive free-oir temperature gauge with a time lag of only one second, the thermoresistor or "thermistor" (below) was improvised in Florida by averworked NACA and Univ. of Chicago instrument experts. Nicknamed "solt-and-pepper shaker," the thermistor was mounted above the hood of each P-AI. Baffles in its nase kept rain from soaking the resistor (at left, outside its aluminum housing), a needle of carbon material When a low current was passed through the resistor its resistance varied greatly with even a slight change in temperature. The current was amplified and a cockpit dial recorded the temperature change.

BEECHCRAFT BONANZA. The butterfly tail, replacing radder and stabilizers, is introduced into the civilian plane flotd with this new, all-metal; four-seatur. A six-cylinder, air-cooled, pancake engine, seared to an adjustable propeller, gives a cruising speed of 175 m.p.h. Prize: \$7,345, f.e.b., Wichita, Kans.

ODD JOBS
for ODD HOURS

The 50-foot throwback to prehistoric times shown above is one of the inflated rubber monsters that Ed S. Conner, of the Goodyear Tire and Rubber Co., dreams up in his spare time. When they are not charging hunters for the benefit of a photographer, the novel products of Conner's imagination are rented or sold to enliven parades or play a part in advertising stants.

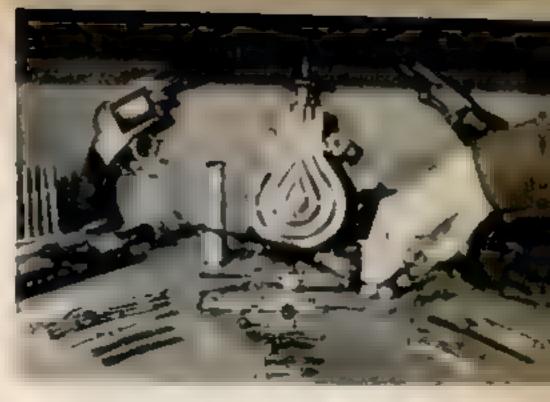

Photos from a film produced by JERRY FAIRBANKS

Working with an acetylene torch and molten metal instead of the chisel and stone that most sculptors use, Floyd F. Nichols (right), David City, Neb., creates miniature works of art from steel welding rads. He studied anatomy before he took up his unusual art medium, and now puts his knowledge to use in his hobby. He specializes in the partrayal of horses and men in action.

There are fewer crowned heads than there used to be, but many of the crowns wors by post and present royalty have been recreated by Max Berman (above). Santa Manica, Callf., a retired jeweler, in his collection of synthetic reproductions. He is shown putting the finishing touches to one of his capies. Among his collection are reproductions of the crowns of Nicholas' II of Russia, Napoleon, early English bings and many others, as well as scepters and swards. Motion picture studios rent his glittering imitations for court scenes.

Making scale-model miniatures of firearms and ammunition is the pastime of Carlos Dinis, Beverly Hills, Calif. His collection is shown above, with its proportions emphasized by the bulk of the normal-sized weapons in the background. Items in the collection range from pistals to machine guns, and represent developments covering several

hundred years—from wheel locks of the loth century to weapons employed in World War II. Some of his tiny creations, especially the pistols, are scarcely larger than a motch, but he fashions every part exactly to scale. Seated at his workbanch (at left), Diniz examines his model of a presentday automatic rifle, which is not much bigger than an ordinary lead pencil.

"Littletown," a miniature village built of odds and ends, was begun 11 years age by William Murray, Chesterton, Ind. It is a complete town, even to the ships sailing its waterway for the enjoyment of young onlockers, and includes a hotel in addition to its houses, shops and public buildings.

The three color photographs on this page are all made from the same underexposed color transparency. All were made with the aid of the Birch-Field Variscope, and demanstrate the range of color correction it makes possible. The picture at the top has too much blue; the one at lower left, too much red. The lower right-hand version, gaining by the experience obtained in making the preceding two, represents a close approximation of the actual colors of the original subject.

# Printing Color through a Bull's-Eye

Variscope replaces filters and makes truer pictures.

By E. J. MURRAY

Reproducing photographs in natural color, long a difficult and uncertain process, can now be done with great accuracy and without the use of cumbersome multiple filters. The new Variscope does the trick.

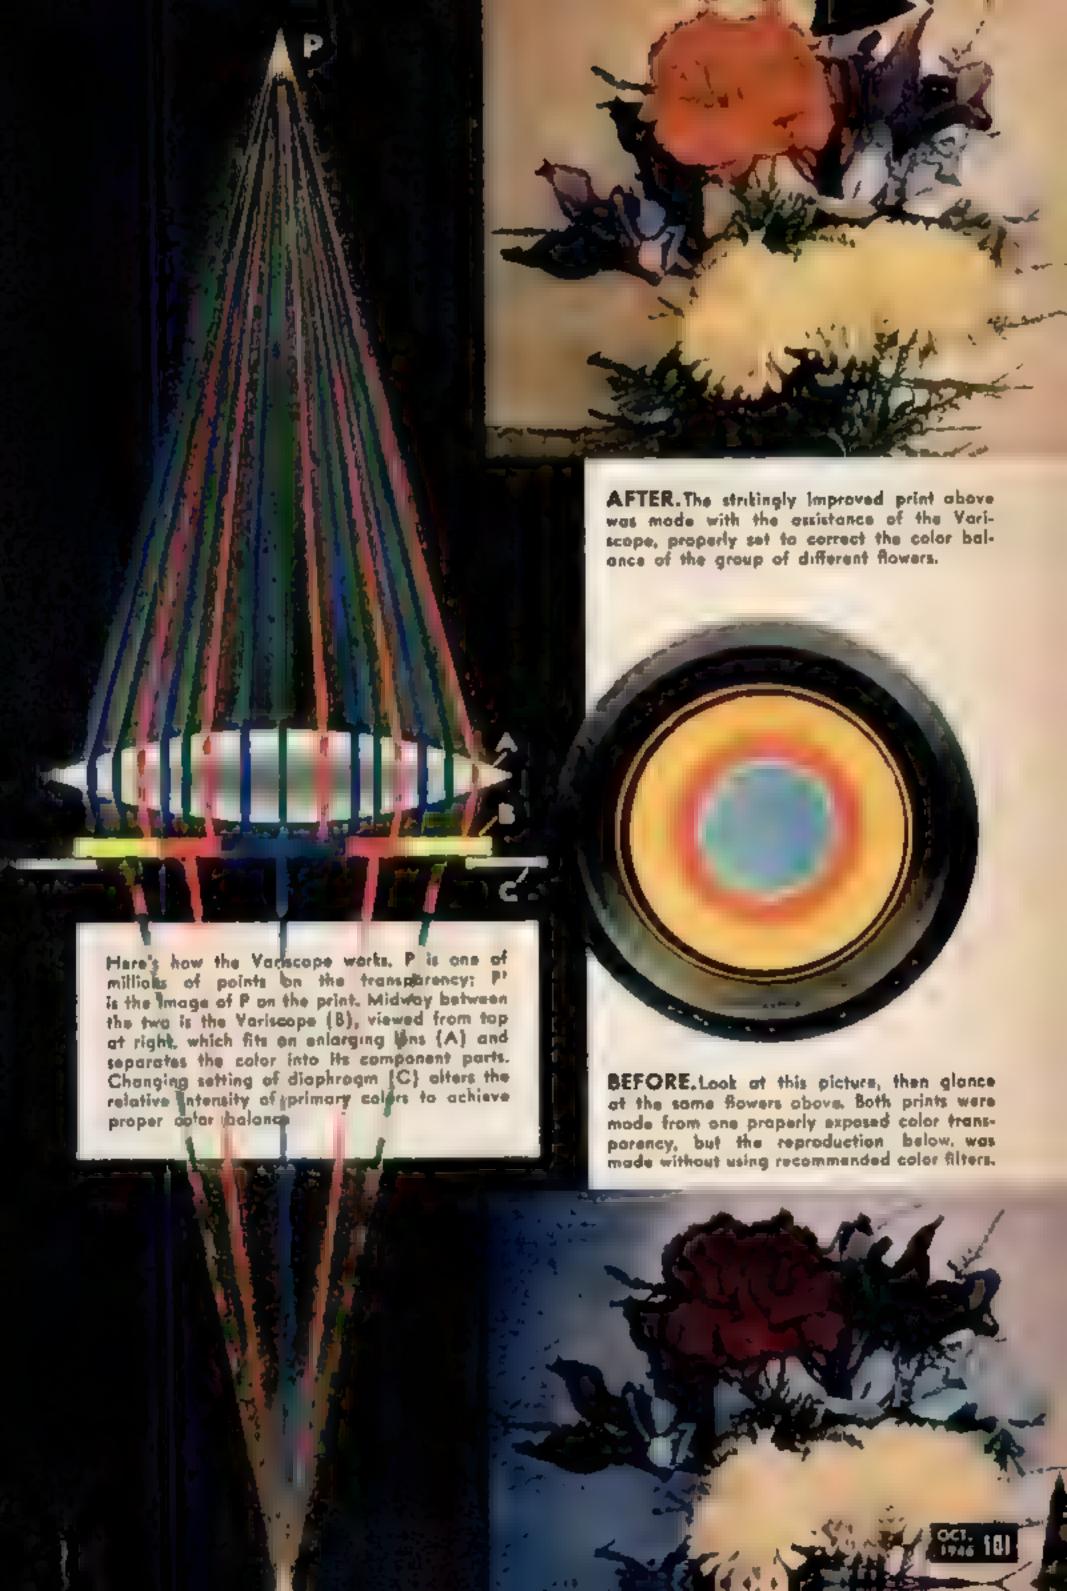

Developed and perfected by C. H. Birch-Field, of New York City, and his son, Arthur, the same team that invented the Iriscope (for making color projections from black and white stills), the Variscope looks like a small transparent bull's-eye. It is a disk made up of three concentric rings of color, mounted in a fixture that roughly resembles the iris of a camera lens. When attached to optical equipment, it can be adjusted with a twist of the fingers to control and modify color balance in transmitting photographic images from a transparency to a reflecting surface, such as printing paper or a plain wall screen.

This apparent simplicity is deceptive so

PSM Photos by HUBERT LUCKETY

far as the construction and perfection of the Variscope are concerned. Actually, the three color bands are extremely complex factors. Each consists basically of one of the subtractive primary colors: red, blue and yellow. To the color in each ring has been added a certain amount of each of the other primaries. The proper amount for the best results and the width of the individual bands have been determined after long and painstaking trial-and-error experimentation. With nine variable factors-three colors, three intensities, and three band widths—the possible variations run into tens of millions. However, by a stroke of good fortune, the Variscope was perfected after a mere 1,200 tests. In developing the Iriscope young Birch-Field made more than 30,000 trials.

Basically, the uncontrollable factors in color photography resolve themselves into one major problem—the actual production of the various types of tripack color film and paper. In each case, these products consist of a simple base-film or paperupon which are superimposed three separate layers of chemical substances. Each layer is sensitive to one of the primary colors and contains appropriate dyes and coupling materials. For proper color balance, the required thickness of each one of these layers is 5/1,000 of an inch, a coating thinner by many times than the thinnest sheet of tissue paper. And a variation of a mere 1/50,000 of an inch, while invisible to the naked eye, is sufficient to ruin the color balance in any picture. The mechanical difficulties involved in obtaining a sensitized layer with an over-all accuracy closer than

1/50,000 of an inch are practically insurmountable. In consequence, all tripack film and color paper must be corrected, both in exposure and printing, with a variety of filters.

The trouble with using filters doesn't stop right there, either. When light of any color mixture passes through a filter, it passes as a diffused mass of color, and some of the light of all colors is absorbed by the filter. The light that then reaches the reflecting surface—the color paper or the screen—is thus not only diminished in intensity but has been affected in all of its color components rather than just the one for which the filter was originally used.

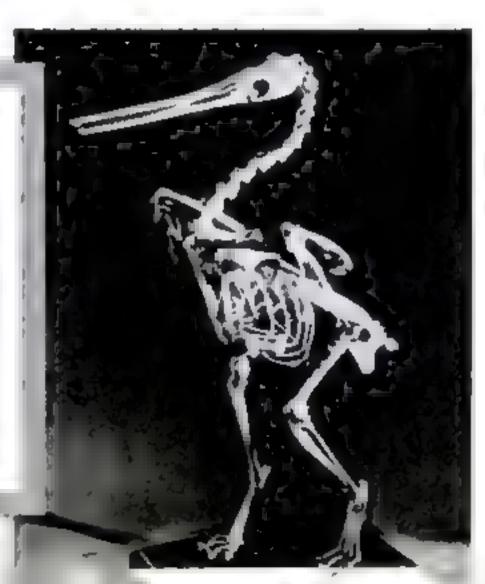

The Variscope overcomes these difficulties because it is not a filter. It is based on the principle that light of any given color is a mixture of the primary colors in various amounts. It separates these colors as they pass through it and recombines them again at the focal plane. None of the purity is lost because each of the primary colors passes through its proper color band. At the same time, the amount of each color passing through the Variscope can be controlled by the irislike action of the mount.

Obviously, if the correct color balance is obtained for one color point, it will be the proper balance for all color points, or for the image as a whole, in the case of a single transparency.

From this, and from the illustrations on pages 100-101, the possibilities of the Variscope can be seen. It greatly simplifies laboratory technique by eliminating filters entirely, and by combining color control and enlarging into one simple operation.

# Anatomy Students' Quiz Bird Is Three Other Creatures

DESIGNED to test students of comparative anatomy, the birdlike skeleton at right was built from the hind leg bones of a cat; the neck, wings, breastbone and backbone of a chicken, and the skull of a pike. Some students spotted the fabrication, but others identified it as anything from a pterodactyl to an "archeoptery." The oddity was created by Ward's Natural Science Service, of Rochester, N. Y., at the request of Dr. D. W. Davis, of William and Mary College.

# Prescription

Filling a blast furnace by the wheelbarrow load (above) was a back-breaking job in 1873. Lower right: using the optical pyrometer, in modern precision steelmaking, to measure temperature of malten metal in a 150-ton-capacity open hearth at the South Chicago works of the Carnegie-Illinois Steel Corp.

# By HARTLEY E. HOWE

STEEL experts like to tell about the old-timer who heard a couple of cubs arguing about how much carbon there was in a piece of steel. He picked up the sample, broke it, tasted it, and said it was .40 percent carbon. Skeptics then sent the sample to the lab. It proved to be .38 percent carbon!

Millions of tons of steel have been made with such by-guess and by-gorry methods, but they are no longer good enough. Precision instruments now are taking the place of the accumulated skill of eye and hand—and human tongue. Today's expert, for exuring the exact extent to which tells the carbon content by measuring the exact amount by which the steel interrupts a magnetic field.

For years, steelmakers estimated temperature by plunging an iron bar into the molten metal. If the end melted off clean and square, the steel was "just right." Now an immersion pyrometer measures the electric current set up when wires of two different metals are heated at their point of contact in the furnace.

To measure the silica content of slag-important in checking on

A 200-ton ladle dumps malten from into a furnace at the Great Lakes Steel Corp., where N-A-X High Tensile steel is made. This new-type metal uses chromium, succonium, manganese and other alloys to make a product that is ductile, resists impact, fatigue, corrosion, abrasion, and has good welding properties.

Topping a 250-ton open-hearth furnace. The liquid metal runs into a table that will carry it to be poured and cast into ingots. Carefully controlled temperatures are vital in making prescription steel.

104 SCIENCE

the progress of steelmaking-the old-timer used his eye. Now the slag is poured into a metal tube, called a viscosimeter, and the distance it runs down the tube in a given time tells the story.

This shift from shovel to laboratory methods makes tremendous change in the final product possible. Steel is no longer a single metal, but a family of thousands. From these the metallurgist can draw a metal suited to practically any specialized purpose—or concect a new one almost as easily as a pharmacist mixes a prescription.

The jobs that steel must do nowadays vary as greatly as those of people. Structural steels that go into girders and beams lead a comparatively simple life. All they have to do is carry a static load—until a hurricane comes along and produces some highly dynamic effects against the outside of the building. Rail steel, one of the first of the special types and still the finest steel produced in large quantities, has to take the pounding and grinding of tons of heavy cars bouncing up and down. Another branch, the stainless steels, must stand the corrosive acids that go into making pickles—or photographic developers.

Heat-resistant steels must hold their

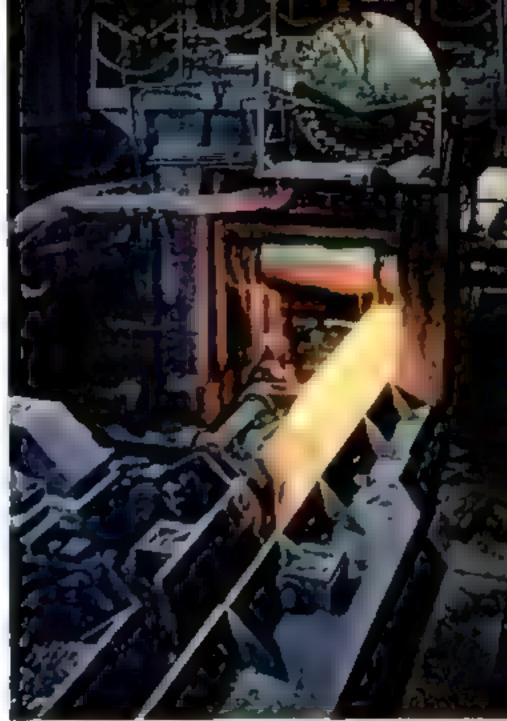

strength and shape while being repeatedly heated to 1,500 degrees F. and then cooled again. Other steels must endure the icy chill of quick-freezing equipment. Free-cutting steel must machine easily for acrew-making. Tool steel has to keep its super-hardness while glowing red hot as it cuts into revolving metal. Steel pipes and ship plates must be easily welded.

Engineering steels—among the most important groups—must take every conceivable kind of load in such forms as automobile crankshafts. Spring steels must bend under a load—and bound back into shape. Electrical sheet steel must have special properties to save power in generators. And yet other steels must roll readily into plates, be easily drawn for wire, enamel smoothly for bathtubs, be highly magnetic for compasses, or even combine a hard surface with a tough core for armor plate.

To make these special steels, the metallurgist changes the chemical composition of plain steel. He varies its internal structure by heating and cooling it. He works it by hammering or stretching, which also changes the physical structure, or he combines such techniques.

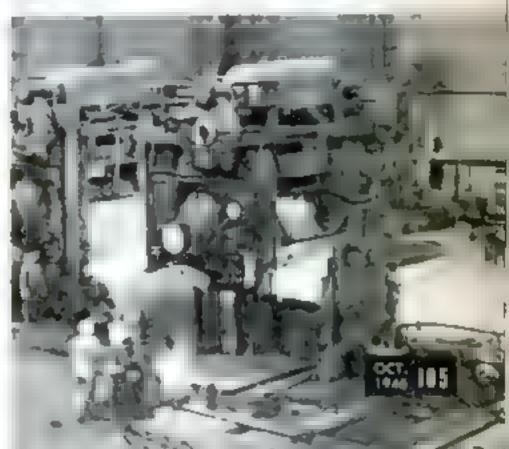

Basically, steelmaking consists of remov-

At slabbing mill, ingots are rolled until 5 inches thick, 54 inches wide, then cut to order. Thirty percent of original ingot is lost in the finishing

ing impurities from pig iron or scrap Now it has been found that some 'impurities" can be helpful. Small quantities of phosphorus increase tensile strength, elastic limit and corrosion resistance. The right amount of sulphur makes a rolled steel easy to machine: sulphide fibers break off and keep the cutting edge free of chips. Silicon

At stripping mill, the largest in the world, ribbons of N-A-X steel 5 feet wide and Ve-inch thick are rolled at a rate of 22 miles on hour. A single ingot will produce a 500-foot-long ribbon.

improves the bounce of spring steels, jacks up the tensile strength of structural steel, and is particularly helpful in making special steel for electrical apparatus.

Tiny amounts of other elements improve the quality of steel—just why, nobody knows. A touch of boron—one of the best of these "needles"—so small that commercial analysis cannot detect it in the finished

metal, makes steel both harder and stronger

without losing its toughness.

# Changes Wrought by Alloys

More important are the pure metals that are alloyed with steel. Chromium not only hardens it, but provides strength at high temperatures. Even more valuable is chromium's high corrosion resistance, which makes stainless steel resistant not only to rust but to the corrosive liquids used by the chemical industry.

Stainless steel is made of 18 parts of chromium with eight parts of another common alloy, nickel (the other 74 parts are steel). The nickel adds toughness. Manganese is another tough baby that makes steel stronger but not more brittle. Manganese also increases the depth of hardness—important since large pieces of Steel do not harden equally all the way through. All commercial steels contain at least a little manganese.

Tungsten, which comes from the interior of China, has the highest melting point of any metal. As an alloy, it enables steel to keep its hardness when heated and is used for the tools that cut metals at high speeds. Molybdenum has the same function—and since it comes from Colorado it has been a lot easier to obtain in recent years. "Moly" has also replaced scarce nickel and chromium in structural steels.

Copper increases resistance to atmospheric corrosion and at the same time builds up strength and hardenability. Cobalt—very expensive—is primarily a toughener, used together with tungsten. Aluminum is often combined with chromium to produce the proper grain in a surface-hardened steel. Vanadium, which comes from mines high in the Andes, improves tensile strength and elasticity, and is particularly important for increasing resistance to fatigue—the tendency of steel to fail under certain conditions of repeated stress.

# Complex Ingredients

Some of these alloys are used singly—many are combined into complex alloy steels. In World War II, when imported nickel and chromium became scarce, it was found possible to replace many standard

engineering steels with new types. In these National Emergency steels, small amounts of several alloys are used to produce steel equal to that containing large quantities of one or two of the scarce alloys. The future of these new NE steels is still in doubt. They use smaller amounts of expensive virgin alloys, but they require much more care in sorting the scrap before dumping it into the furnace. It is yet to be determined which is cheaper.

New alloy combinations are constantly being discovered. One of the more recent ones-the high-temperature-resistant steels -made possible our high-level bombers and the superspeed jet planes. The turbosuperchargers that enabled aircraft to fly almost eight miles above sea level had to endure the flery breath of the flaming exhaust gases that drove them. Jet engines have to withstand even higher temperatures up to 1,500 degrees F, or more in the rotor blades. Any ordinary steel loses its strength at these temperatures and begins to "creep" or change shape under stress. But metallurgists developed new alloys using nickel, chromium, molybdenum and other elements -and made possible speeds approaching that of sound.

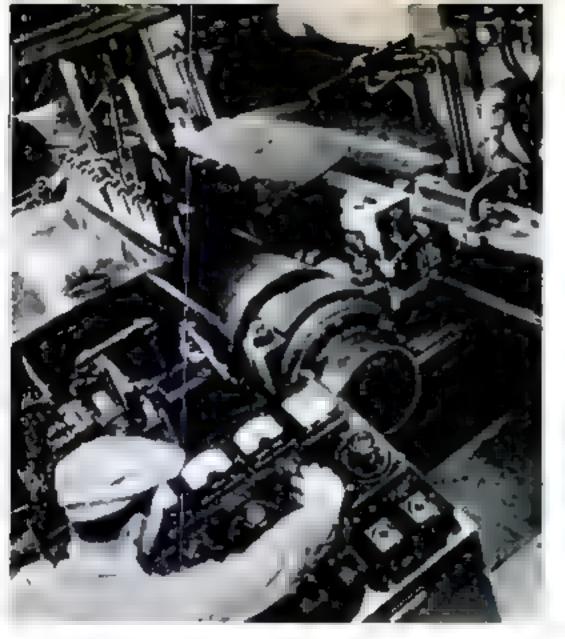

Now engineers are demanding metals which will take even higher temperatures—up to 8,000 degrees. The researchers are scratching their heads—and going back to their laboratories.

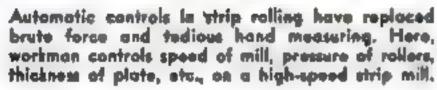

### Giving Steel Added Strength

Working steel—forging it, rolling it, drawing it out into rods or wires—increases its strength. These processes usually come in the final fabrication. Long before, the steel has been strengthened by heat treatments that alter the internal structure of the metal, making the grain finer (which improves the quality) while relieving the internal stresses (which make the steel brittle).

The Saracen swordsmiths took a slave with them out into the desert where they forged their famous Damascus blades in secret. When the sword reached a certain color in the fire, indicating the right temperature, the smith would pull it out and plunge it into the body of the slave. That unfortunate's internal heat was, of course, close to 98.6 F., and he provided a controlled-temperature cooling bath.

Modern heat treatments are less dramatic but considerably more effective. The steel is first quenched by heating it above its critical temperature (varying with its composition), then suddenly cooling it. The heating dissolves the alloys and forms a solid solution of carbides in the ferrite

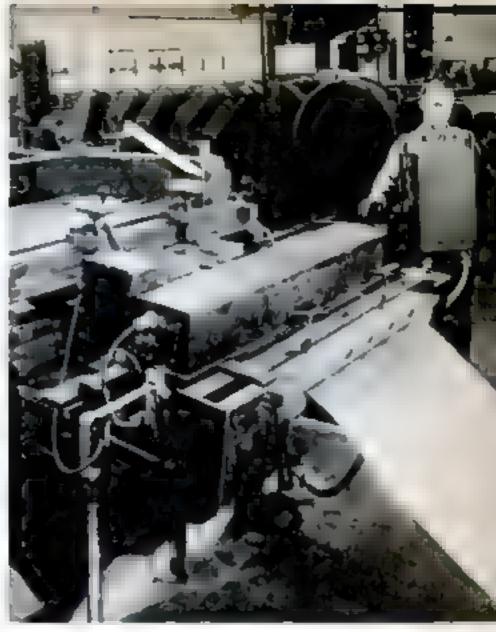

created by the iron in the mixture: the cooling again changes the molecular structure, to martensite—a mixture of carbides finely dispersed in the ferrite. The finer the dispersion, the finer the steel, but since martensite is brittle as well as strong, the steel is then tempered. It is again heated—not quite as much as before—and the carbides and ferrite rearrange themselves in a coarser structure. When the steel is cooled a second time it is somewhat softer but a good deal tougher.

Additional heatings and coolings may be carried on through annealing and normalizing processes that further modify the structure. Recently experiments have been in the opposite direction—freezing steel to temperatures far below zero to make it harder. Here the research metallurgists are coming up against the fundamental structure of matter, exploring why some things are strong, some weak, some hard, some soft.

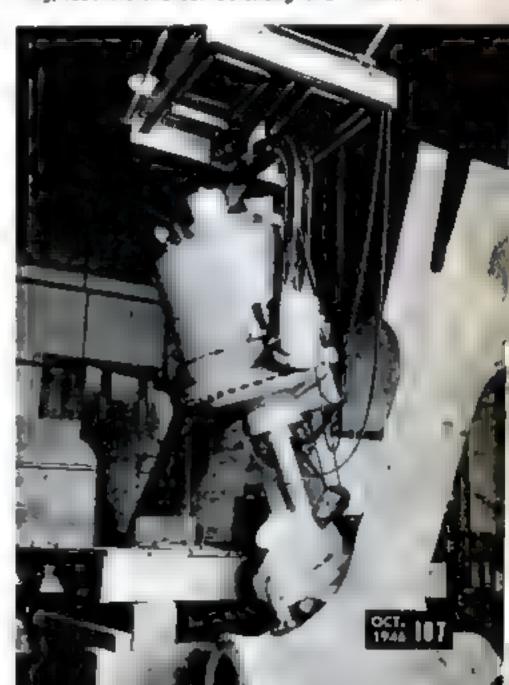

Steel men just smile when they hear about the coming "age of plastics" or "age of light metals," which some prophets are proclaiming. They have what is today America's biggest industry and the world's most versatile material.

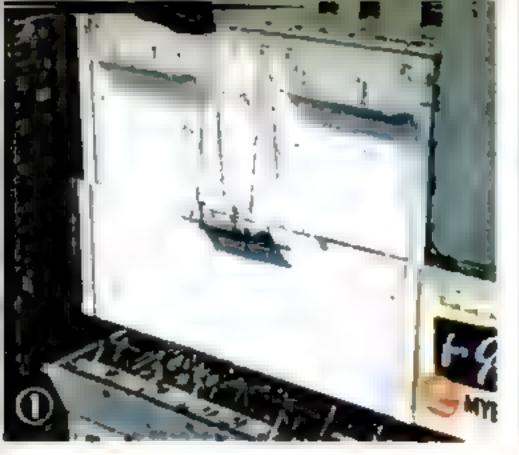

But they also know that steel will have to fight to keep its place as the king of metals with new prescriptions for new uses.

Even detection of pinholes is done automatically.
As steel rolls under electric light, a photoelectric cell sets up a current if light passes through.
Bethlehem Steel developed this detector apparatus.

Penetrating X-rays also have a place in the modern steel industry. Below, a technician concentrates the pinpoint beam of a powerful X-ray machine an a gigantic costing to search out internal flaws. The machine can be moved back and forth, and its long, tube-like and can be swung in a vertical arc.

# How a Sign is Painted

A water-color drawing, scaled one inch to the foot, is squared off by the pictorial painter for his own guidance in putting such outsize art work on a board with row point. This is shown below, overlaid on an outline sketch of picture and lettering that is keyed to serve as a color chart.

or the lighter that made the World Lighter Conscious

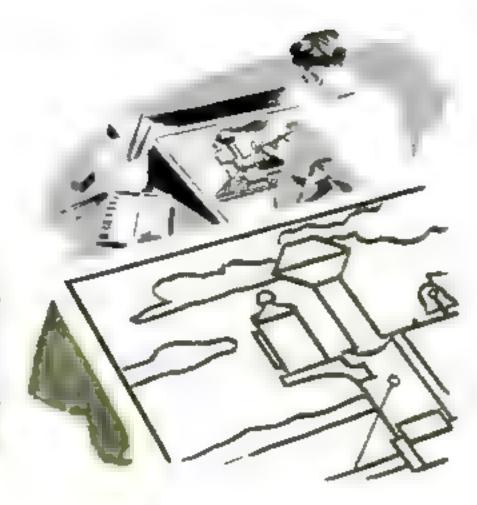

Neck-croners who watch skyscraper artists often wonder how they work out the big painted boards. These pictures of the jumbo sign above Fifth Avenue and Forty-second Street show the successive steps. (1) First, the old sign is blocked out. This is done by a crew (five men) that puts up the scaffolding and gives the entire area one heavy coat of gray paint or, in the case of a rush job, a coat of quick-drying white. This craw also delivers in a metal box all the cons of colored paints needed for the new sign, (2) Then a pictorial painter and a helper, who does the lettering, take over. They square off the board and, with chalk and indelible pencil, sketch the picture and lettering of the new sign, (3) These scaffold Rembrandts carry only their brushes and a few tubes of paste colors that the pictorial man may need to bring out highlights in the art. (4) The 41-by-61-foot sign (below), completed in four days, will retain high visibility for at least six months. Arrow points to the box of paints.

## NEW IDEAS from the

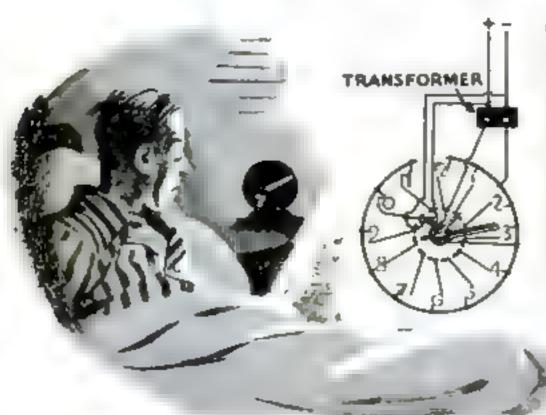

INVENTORS

Keeps Colors in Line. A resinand-heat treatment of the printed outlines of pictures in children's paint books, devised by Will H. Connelly, of Park Ridge, Ill., prevents water colors from running and marring the painting. In printing the pictures, resin is applied to the wet ink; then, under heat, the lines swell or puff up, forming alight barriers or dams between the sections of the drawing to keep colors separate.

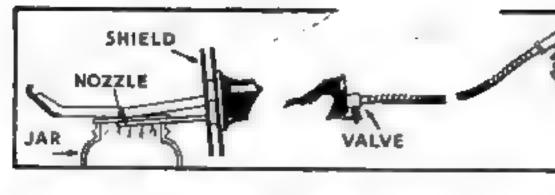

Faucet Fountain. Drinking from a faucet is made a simple matter by the easily attachable invention of Paris Cambs, New Haven, Conn. A. plastic spout, which can be turned in all directions on its axis, is attached by a flexible elbow to the downturned outlet of a faucet of any shape. Turned upward, it provides an easyto-reach drinking fountain that eliminates the need for glasses, which may become unsanitary in the bathroom. The position of the spout can be quickly adjusted to point the stream of water in the direction needed. Bince the diameter of the spout is somewhat smaller than that of the faucet. the water issues at increased force.

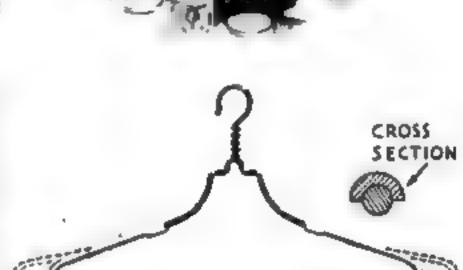

Clock With One Hand, In the blackness of night or at the first light of dawn, bleary-eyed sleepers can tell the time in a wink by means of an electric clock devised by Howard D. Werts, of La Salle, Ill. It has a minute hand and hour numerals made of mean tubes; the hand glows continuously while the numerals light up individually and stay on for approximately 59 minutes, according to the time of day or night. The mechanism of the clock is conventionally oper-

ated on ordinary alternating current, but a transformer is used on the current for the illuminated minute hand and hour numerals.

Teakettle Powers Sterilizer. A flexible extension from the spout of a teakettle, invented by Richard H. Wolf, of Gary, Ind., delivers hot steam to sterilize jars of canned food. A spring-controlled pressure arm above the perforated nozzle helps the canner clamp the lids on immediately after applying the steam. When a cover, held between the short steam nozzle and long, flat metal pressure arm is placed over a jar of hot food, steam is admitted through a finger-operated valve.

Adjustable Clothes Hanger. Since coats and dresses vary considerably in shoulder width, William M. Gallagher, Oklahoma City, has contrived a hanger that can be adjusted to nearly any size of garment. Shaped like an ordinary wire coat hanger, the invention adds two tubular shoulder extensions that slide over the base wire to enlarge the spread. The hanger can be expanded for clothing of all dimensions.

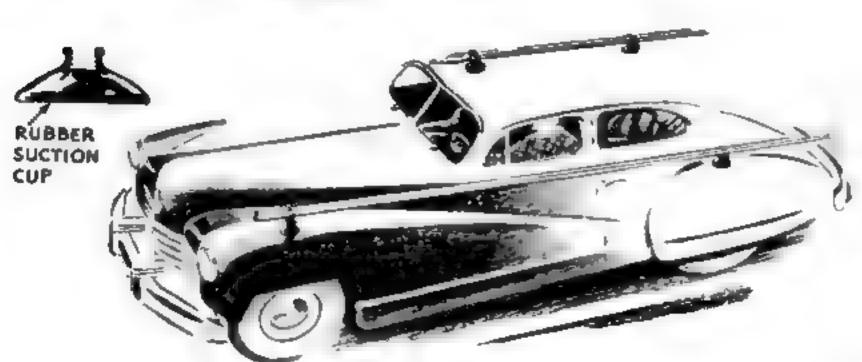

CORK

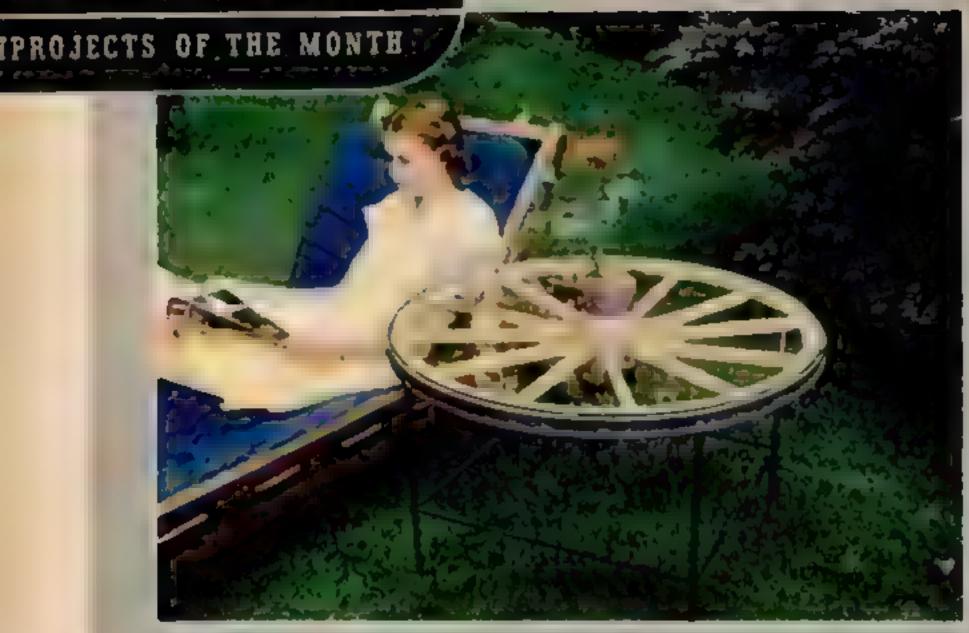

Fishing-Rod Holders for Cars. Originated by H. M. Wood, of Madison, Wis., for the benefit of those who wish to carry fishing rods or other poles conveniently on automobile trips, this contrivance consists of a pair of hard rubber or plastic racks along which the poles may be laid. The

racks are screwed into rubber suction-cup bases, which are then attached in the usual manner to the top or fenders of the car. They may easily be used in the same way on boats. Single racks might be useful for stacking paint brushes or hanging up tools in workshops,

### CRAFTWORK

Sturdy wheels solvaged from the old wagons of pre-outomobile days are in style again, this time as antiques. Beginning on page 148. Eric Sloone tells how to turn them into furniture

Extra-long rubber carries Sky Climber (left) to a high oltitude, while a folding prop and the deep undercamber of the wing and tail insure a slow, flat glide. Ture to page 156 for building plans

Scraps of colorful strip Inlay left over from furniture making have been put to a novel use by one Ingenious craftsman. As seen below, he makes jewelry of them. Details are on page 160.

## make colorful photos

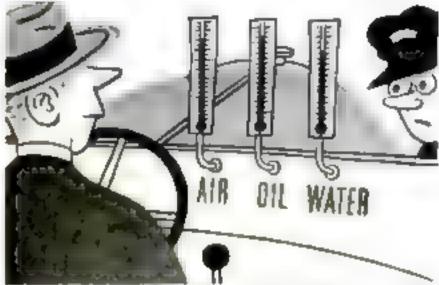

#### Bright Hues of This Season Invite Your Camera.

A UTUMN challenges every photographer to try his hand at color pictures, for at this season nature sparkles with opportunities for vivid transparencies and prints. Yet fall also has its photographic pitfalls.

Yet fall also has its photographic pitfalls. For example, the crystal-clear air and bright colors may deceive you into underexposures, moisture-laden lenses may blur your negatives, and the decreased contrasts produced in nature by the softer sunlight may result in poor print quality. In an article on fall photography, beginning on page 182, Don Storing suggests how to handle your camera in this fine season.

## I'd like to see them make

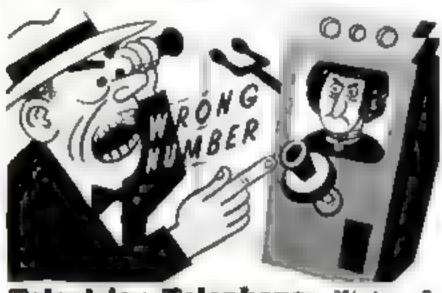

Curioses by SYD LAND! Everybody has his own put idea of some gadget he would like to one in general one, What is YOURST Popular Science Monthly will pay five delices for every such suggestion that its editors decide to publish.

Dashboard That Tells All. Gauges to show the motorist exactly how much air is in the tires, how much oil and water in the engine. Suggested by L. R. Ruegg, Lake Mills, Wis.

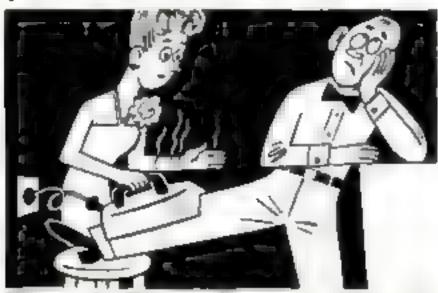

Beds Hung from Celling. Using a pulley system, beds could be raised when the floor needed dusting or adjusted to suit an occupant's whim, says Mrs. R. Kash, Cincinnati, Ohio.

Television Telephone. Victor J. Tunison, Trumansburg, N. Y., believes it would be an advantage to push a button and be able to see as well as hear the person to whom you are phoning.

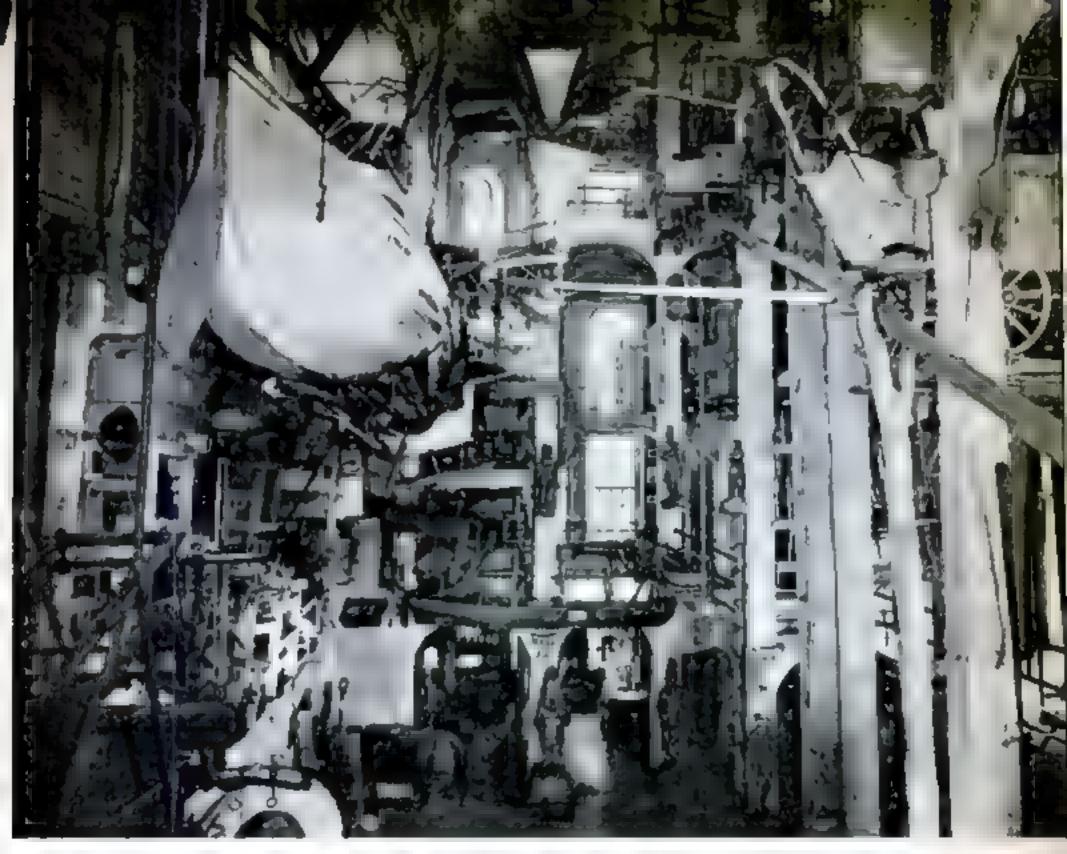

Palette for the Palate. Having wrestled with buffet huncheons, Bruce Deutsch, Clarksville, Tenn., suggests a safety-first service tray shaped and thumbholed like an artist's palette.

Bleetric Pants Creaser. With such a gadget, made to fit into any ordinary socket, Stephen J. Stack, Plains, Pa., believes that a man's trousers could always have a knife-blade edge.

Pain-killing Drill. James H. Gillen, Jr., of Seattle, thinks patients would exclaim, "Doc, it's a pleasure," if dentists could use a liquid anesthetic that would percolate through drills.

A battered but sturdy whaleboat (upper left), a Conestaga wagen (upper right), and a well sweep (right) with a 25-foot crotched support are among the larger tools and mechanisms housed in the Bucks County Historical Society's four-story central holl.

# Old-Time Tools Tell History

Our forefathers had their gadgets to make life easier in the days before steam power and electricity.

By LEIGH MITCHELL HODGES

In A huge concrete museum in Doylestown, Pa.—one of the first wholly
"poured," and woodless from bedrock to
roof ridge—some 26,000 original tools, implements and utensils tell a vivid story of
how Americans lived and worked before
steam power came into use. This major
collection of its kind reflects a broad range
of inventive and manual skill, and impressively emphasizes the part played by stone,
wood, and metal in the household and field
activities of the nation from Jamestown and
Plymouth to the turn of the 19th century.

True to Emerson's dictum that "an institution is the lengthened shadow of one man," this free museum is a monument to the seal and energy of the late Dr. Henry Chapman Mercer, who gave it to the Bucks County Historical Society in 1916, 14 years before his death. He was a local boy, born to esse; was graduated from Harvard, and was lured from the law by a flair for archaeology and folklore. While exploring prehistoric caves and Indian haunts in Pennsylvania he stumbled on many reminders of later pioneers—in barns, attics, and junk piles. These crude but efficient products of primitive handicraft spurred him to a wider search for such relics of early days, and for 40 years he spent much of his time wandering through his own and neighboring states, mostly on bicycle, gathering them in. Many items have been contributed by visitors.

The collection is intended to show the mechanical progress and development of industry. Through the early centuries of

man's rise from savagery, all agricultural and mechanical labor was done by hand. Gradually man began to use his brain more and his muscles less and to conceive and produce machines that utilized animals for motive power. The greatest forward step made in the arts and crafts, after the discovery and use of fire and possibly the wheel, was the harnessing of wind and water power by means of the windmill and the water wheel. By the mid-

the water wheel. By the middle of the 15th century certain heavy occupations were carried on almost entirely by one of these means or the other.

Practically every art, trade, profession and calling that the nation's builders have followed are represented in the Doylestown museum's 69 gallery rooms and alcoves and in the great central well where the larger items are displayed. Every exhibit, from the lard lamp to the lumbering Conestoga wagon, is a genuine antique.

"The collection offers a new way of studying and illustrating history," declares Horace M. Mann, curator of the Historical Society. "Not the political or documentary history of nations, but of man's striving to contend with the forces of nature and supply his creature needs."

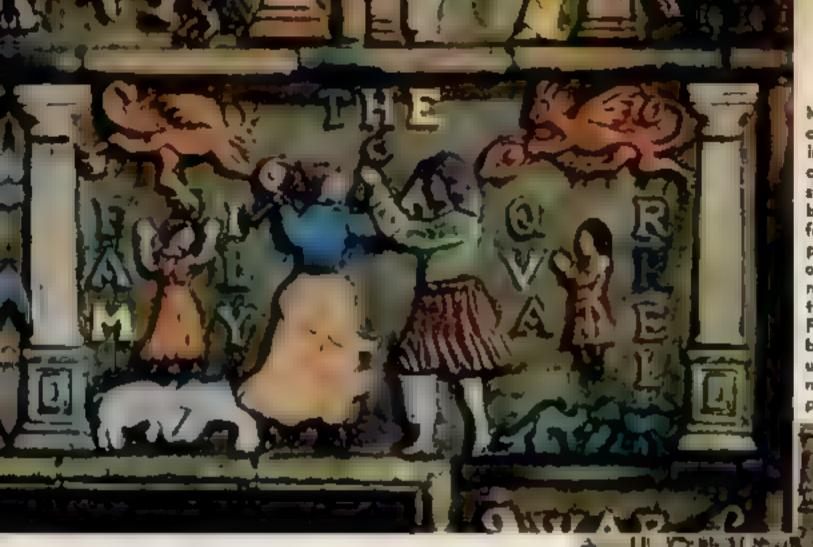

Someone has called the museum a "wilderness of wonders." And thousands of Americans and foreigners have wondered at the ways shown there for conquering the wilderness to which the colonists came, or in which they were born. At the museum visitors see an illustrated story of long labor and hard living; of patience and parsistence. It is the real story of our independence, which was mothered by self-dependence!

Decorated with brilliant tiles designed and made by Dr. Mercer, museum's denor, the original library room with its concrete floor, walls, bookshalves, window frames, and groined ceiling is a dependably safe place for its priceless books and old documents.

The museum has more than a score of cigar-store Indians and other wooden figures, including (left to right) Pocahantas, Punch, a page boy, and a postman. They were the spare-time products of the wood-corvers who shoped the human forms that graced the prows of early clipper ships.

More of Or. Mercer's colorful tiles, decorated in relief with scenes copied from cost-iron stove plates that date back to Biblical times, frame the old-time fire-place (below) that is in one of the museum rooms. The close-up at the left depicts "The Family Quarrel" — husband and wife fighting, urged on by flying demons as the children protest in vain.

This Cancard coach is 110 years old and saw service for many decades between Boston and the immortal Wayside Inn, Sudbury, Mass. It is still in first-class condition.

Built 150 years ago by Patrick Lyan, then America's leading maker of fire-fighting apparatus, the hand pumper below was houled and handled by Philadelphia's leading families and saw service for 45 years.

Highly skilled fingers, with benefit of scissors, dyes and wire, fashioned this beautiful bouquet from feathers of a White Leghorn, and it looks as decorative as it did when it was made, 75 years ago. No Victorian parlor was complete without a glass-domed cluster of feather or wax posses.

Hand-ahiseled from a log of oak, this big screw-nine niches in diameter and six feet long-was used in eastera Penasylvania until 50 years ago to supply the squeezing force for a huge "beam" sider press. The saken beam into which this screw fits is 28 feet long and 15 inches equare, and pivots on a stout upright. Through hand-turned action of the screw, the opposite and of the beam was slowly forced down on a wooden block that fitted into a slotted container filled with alternate layers of ground apples and tye strow, and the juice flowed into a wooden trough.

The Bible in iron." Here is part of the museum's prize collection of 400 iron stove plates, the aldest of which was cast in Germany in 1567; an American-cast plate dates back to 1726. These artistic relics of the first attempt at central heating picture mainly Scriptural scenes. Averaging two feet square, five plates were bolted together, forming a backless "bax" (lower left) that fitted over a hole cut to the fireplace.

Some of the comb-making tools shown below belonged to Michael Crouse, of Lancaster County, Pa., who left his bench to fight with Washington's army and who used them at Valley Forge to make combs for fellow soldiers. Transforming a cattle horn into a hair tool was a tedious process that first required the horn to be heated until soft enough to be slit and flattened, as seen on the "shaving horse" at left. There held tight on a clamp. It was knife-shaved to proper thinness; then the blank form was sawed out of it and fostened in one of the oblang clamps on the bench. After the teeth were cut, the ends were rounded and the edges smoothed

Except for a few windows that can be opened for ventilation, the thousands of panes that admit daylight or enclose museum cubicles are set in concrete sash. Doors are of metal and glass, as shown in this view of the small room that houses the collection of threshing implements. Dr. Mercer planned the fireproof structure as it went along from day to day, without aid of an architect, and did much of the work.

Synonymous with the perils faced by American pioneers is the typical covered wagon, at right, which was used by Thomas Havenden (1840-95) as one of the models for his famous painting, "Westward Hol" It is a well-weathered reminder of the slow, dangerous journeys settlers made across the plains in quest of gold or free homesteads.

PSM photographs by HUBERT EUCKETT

The sturdy habbyharse (left), bearing seams and patches that tell of long and hard use, was the delight of some child more than 100 years ago. This white-pine mount and other homemade toys and rag dolfs share a room of their own.

The pen was mightier than the typewriter when these and machines were in their heyday. The Columbia Typewriter (right, above), patented in 1885, was pushed to the limit at 20 words a minute. The contraption beside it has such modern touches as "cap" shift and bell

The tension telephone set (below) was found in an old carriage factory in Bucks County, Po. The two-way "talkie" was used in the '80s and operated without batteries; a wire stretched tight between two drumheads of vellum or parchment could carry the voice.

The ingenious meet chapper below was a timeand-labor-saver in preparing the makings for sausage, scrapple and mincement. With the aid of gears, driving belt and ratchets on the revolving shaft, the hand that turned the wheel caused the chapping table to turn and the blades to rise and fall, mincing the chunks of park, beef, or apples spread on the circular wooden black. The device was used until recently by many German families in Pennsylvania.

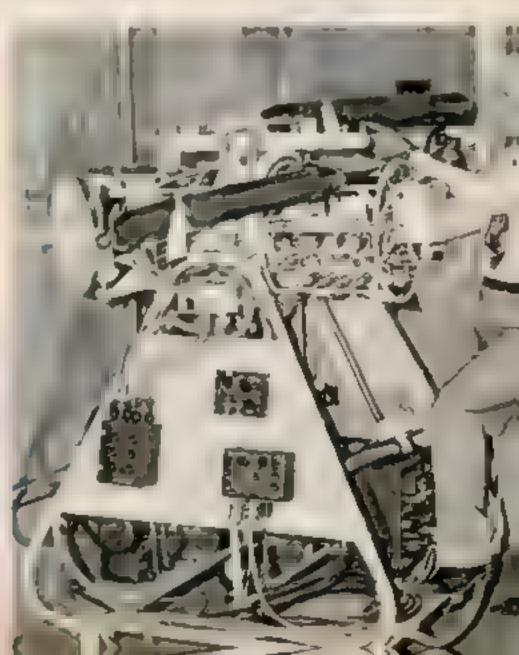

A COPPER room within a copper room, built with lumber that not even a pencil has marked—that is the formula for a radio-testing chamber in which conditions are as nearly perfect as man can make them. Such a room, pictured on this page, has been built at the Curtiss-Wright plant at Columbus, Ohio. Double copper walls bar

outside interference, and inside interference is eliminated by construction details: complete air conditioning, all wiring in rigid conduits, no fire aprinklers or other metal objects to hamper shielding. Even the kilndried, oil-treated lumber is unmarked, because a pencil's graphite might lessen resistance between the copper walls.

The extra-heavy outer door is fitted into position to complete the room's protection against possible outside influences upon the complex radio devices.

W. L. Bauer, designer of the test chamber, checks a radar unit, one of many delicate mechanisms that can now be inspected under almost ideal conditions.

What the well-dressed airman will wear to narrow the gap between what planes can do—and what men can stand.

# How to Live

## Tat High Speed

#### By MARTIN MANN

HOW fast can man fly—and live? In the gulf between the 600-m.p.h. speed that is his physical limit today and the 3,000-m.p.h. velocity of the fastest flying machine (V-2) he has devised hes the unexplored region of aeronautical science. Air Force and Navy scientists, assisted by researchers from many universities and laboratories, are rushing the development of safety equipment to keep man in step with the airplanes of tomorrow.

Already under test are new flying suits, parachutes, automatic releases, deceleration straps, pressure cabins, and quick-exit devices—all needed to overcome the extra dangers of supersonic speeds and ultrastratospheric altitudes.

Wartime experience with 400-m.p.h. fighters gave forewarning of the difficulties to be expected in bailing out of high-speed, high-altitude aircraft. This important problem has been attacked at Wright Field, Ohio, by the design of an automatic three-piece escape set including a seat ejector that literally shoots the pilot clear of a plane, an aneroid parachute release, and the jerk-less, nonswaying ribbon parachute. All are self-operating—the airman does nothing from

the time he pulls the ejector trigger until he lands on the ground.

The seat ejector was developed to meet a need that existed even with airplanes considered slow by present-day standards: pilots jumping from the cockpit did not fall fast enough to escape being hit by tail surfaces or other obstructions. With the new Air Force device, the filer and his seat are

The propelling mechanism is a small

shot 60 feet straight up in one second. A second automatic explosion then disconnects

the strap holding the man to the seat and

opens a small parachute to pull the seat

away, leaving the man to fall free.

87-mm. gun mounted vertically in the cockpit behind the pilot. Instead of the usual projectile, a long tube, attached to the seat, fills the gun barrel. When the pilot pulls the trigger, near his right leg, the explosion of the 37-mm, shell expels tube, seat and pilot with almost instant acceleration to the 60-feet-per-second speed. This rapid acceleration would impose severe strain on the man, pushing him down into the seat with a force equivalent to 20 times his normal weight-much like the effect felt in an express elevator, but exaggerated hundreds of times. The harm this strain may cause, particularly to the spine, is still being investigated, although the first test with a human being was made without injury.

Once clear of airplane and seat, the flier still faces a double hazard. He must drop quickly to an altitude low enough to give him sufficient air—if he opens his parachute too soon he dies from anoxia (lack of oxygen); too late, he smashes into the ground. The aneroid parachute release eliminates both dangers by opening the 'chute automatically at a preset altitude.

This new release is basically an aneroid barometer, which contracts with increasing atmospheric pressure. When the falling man reaches the predetermined altitude, the atmospheric pressure at that height causes

the aneroid unit to contract and fire a small shell—about the size of a 12-gauge cartridge—which releases the rip cord. The aneroid unit can be set for a particular altitude at any time, on the ground or in the air, so the pilot can change the setting to meet the conditions of his flight.

An ordinary parachute, opened at extremely high speed and altitude, would jerk the flier hard enough to injure him or even rip the harness away. To prevent such accidents, a unique parachute made of interlaced ribbons is used. The ribbon parachute eliminates opening shock by permitting some of the air trapped under its lattice-like canopy to escape through the spaces between ribbons, so that the jumper slows down gradually to a safe rate of descent

This gradual deceleration also makes the ribbon parachute valuable for high-speed jumps at lower altitudes. It has been tested at velocities as high as 375 m p.h. with good results.

Even this new escape set will offer protection only up to 450 m p.h., reports Brig. Gen. Malcolm C. Grow, the Air Surgeon General. Tests indicate that the air pressure at higher speeds would be too great for the human body to withstand safely. For bailouts at extremely great velocities

and altitudes, Gen. Grow predicts the use of a pressurized cabin, or capsule, which can be ejected with the flier inside. A parachute would be attached to the capsule itself.

Another method of reducing opening shock in parachute leaps is being developed at the Research Institute of the Naval Medical Center, Bethesda, Md. Workers there, under the direction of Comdr. Howard R. Bierman, have designed a safety humess using a special undrawn nylon, which stretches inelastically (without recoil) to safeguard pilots in crashes. The harness could also be used to provide protection against most of the sudden jerk accompanying the opening of a standard parachute. Costing only a few dollars, the new harness has the advantage of economy over the ribbon 'chute, which is more than three times as expensive as the standard equipment.

The undrawn nylon harness also promises protection against "ram effect," or sudden deceleration, a danger which becomes vitally important at very high velocities. Engineers fear that, in the event of engine failure at

supersome speeds, air friction would slow the aircraft so sharply that passengers would be thrown forward and crushed—just as if the airplane had flown into the side of a mountain. The nylon harness might decelerate the occupants gradually enough to prevent harm.

High speeds introduce another unusual danger: blackout, or loss of consciousness in fast turns. In this case, a partial solution was found in special flying suits, called G suits, early enough for them to see combat use.

Blackout results from the tremendous centrifugal force acting on a pilot when he makes a tight turn at great velocities. This force pulls the blood downward from his brain, numbing it and causing temporary blindness or unconsciousness. Since the effect of centrifugal force on a pilot is similar to the action of gravity, it is usually measured in Gs, or the apparent increase of a man's weight over his normal, gravity-caused weight. Thus, standing still on the ground a man feels 1 G, while in a 2-G turn his weight seems to double, in a 3-G turn, triple, and so on.

The parachute worn by the handsome dummy at right is equipped with an aneroid release. Using it for a free fall to safe altitude, pilots need not worry about pulling the rip cord too soon or too late.

Interior view of a B-29's rear pressurized cabin. It provides livable pressures at high altitudes, but does not satisfy ultrastratospheric needs.

To keep the pilot's blood up in his head -where it belongs-in high-G turns, Air Force and Navy researchers, aided by the Mayo Clinic of Rochester, Minn., and the Berger Brothers Company, New Haven, Conn., developed special suits containing air-filled bladders that press against the abdomen and thighs to prevent blood from draining away from the upper part of the body. The supply of compressed air to these bladders is regulated by an automatic valve, controlled by centrifugal force. As G increases, the valve admits additional air to the bladders, causing them to expand and press more tightly against the pilot's body. Decreasing G lets air out of the bladders.

The G suit adds about 2 G to the average person's ability to withstand 5 to 6 G. Safe turns as great as 10 G have been reported, however, by P-80 pilots wearing the suit.

Since the faster postwar airplanes will undoubtedly require turns of still higher G,

better methods of surmounting this difficulty are being sought. Now in the design stage are prone cabins, in which the pilot lies flat on his face. In this position blood would not be pulled down from his brain, with a resulting increase in G tolerance.

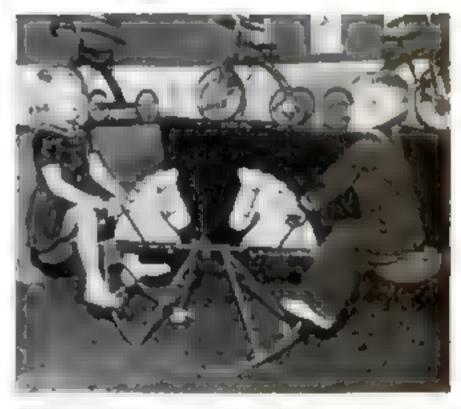

Invariably linked to greater speeds are higher altitudes, with the accompanying problems of oxygen supply and low pressure. Oxygen masks now in use furnish merely a partial solution. Pressure cabins, successfully employed in the B-29, can make up only part of the difference between livable pressure and ultrastratospheric pressure because of the danger of explosive decompression—sudden accidental loss of pressure that might seriously injure the occupants of the cabin. New pressure suits permitting complete freedom of movement are in work, but are not expected to be available for two years.

The speed of sound—only yesterday an apparently impassable limit—seems sure to be exceeded very soon by piloted aircraft. The Navy has already driven its ram-jet engine to 1,500 m.p.h., while the V-2 can reach 3,000 m.p.h. Now the No. 1 problem is no longer how fast man can fly, but how fast he can fly—and live.

For FUN and HARD
KNOCKS

Fun in a bowl, and excitement, too. The toy is called a tumble top, and is made of aluminum with rounded edges. Allwork Co., of Oakland, Calif., manufactures it.

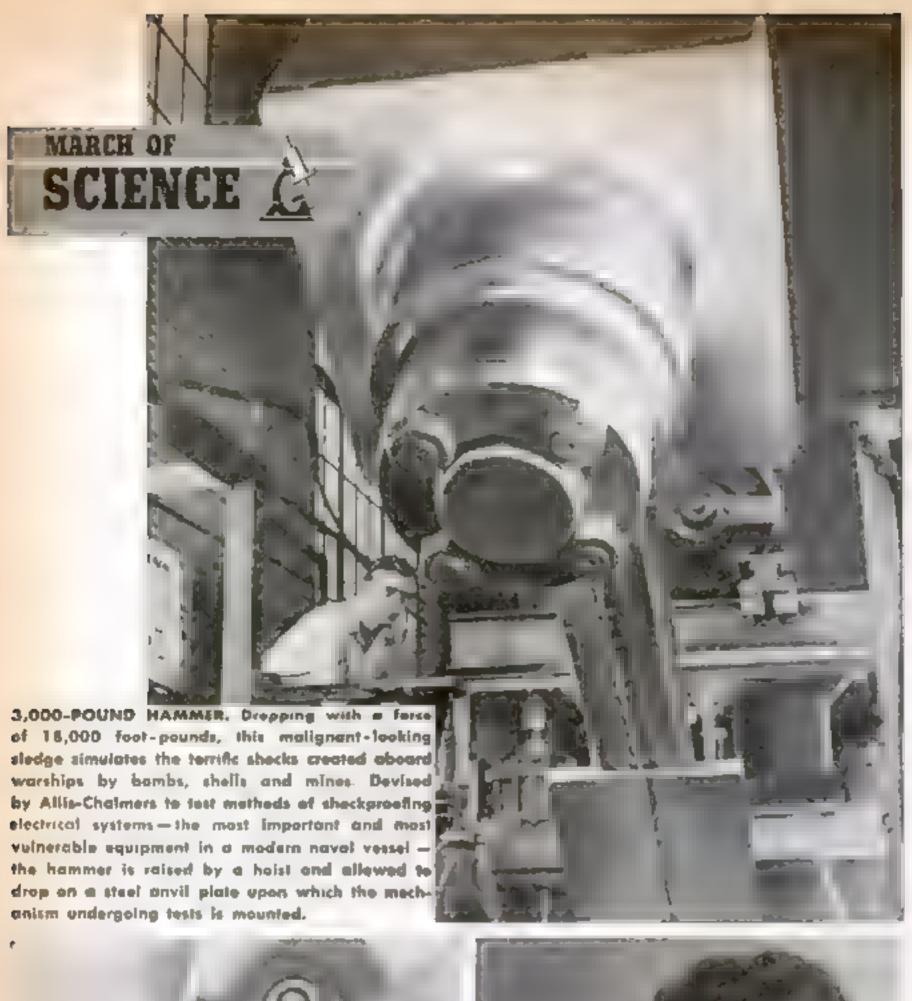

This cross between a racking horse and a teetertotter combines the best features of both. Pads beneath the seats act as shack absorbers when the frolicking gets rough. The plaything is made of tan metal by Houk Brothers, of Los Angeles.

Proctically croshproof, this rugged metal scooter has light pressed-steel wheels, which contribute to its strength. An automobile-type bumper adds safety.

Here's a heavy-duty train, made by Timbertoy Co., Burbank, Colif., that challenges Junior's destructiveness. The locomative, tender and express car are stardily built of thick wood.

OCT. 125

MAKING RADIO WEATHER-CONSCIOUS. Forseing ranges of 2,000 miles for ultrashort waves, radar and television, Navy electronics experts in the Aristona desert are measuring the effect of atmospheric changes on high-frequency broadcasts. Transmitters (below), ranging from 170 to 25,000 megacycles, ride an elevator up a 200-foot tower (above) for broadcasts to two similar towers 25 and 50 miles away. Varying frequencies for different atmospheric conditions increases the range and also provides data for weather forecasting. At left, a meteorologist measures dew points by sending an automatic counter to different levels of the tower.

# Planes that NEVER Fly

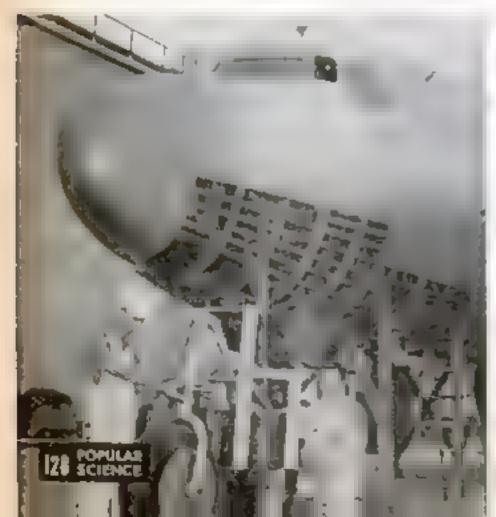

Mockups, the plywood predecessors of future air liners, save millions of dollars by showing engineers what they can do and how to do it.

Exterior of the huge wooden counterpart of the Douglas DC-6, first of which is already flying Accompanying

An 80-pound plywood version of the plane's nose wheel is fitted in place for retraction into its well. This permits an accurate check on tolerances, calculated by engineers, before actual construction in metal begins.

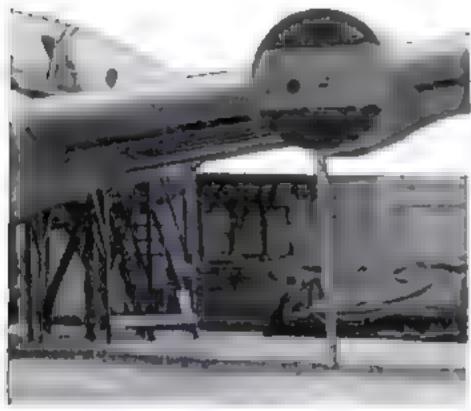

Mechanics Install a dummy Proff & Whitney engine, making certain that all accessor es and lines will function and that all parts are access bie. The propeler is of wood, too.

OF ALL the complex products of aviation, perhaps the most valuable are wood-and-fabric creations that have a top speed of zero miles per hour and never leave the ground. Somewhere in each sprawling aircraft plant sits at least one mockup, or model, of a plane that soon will ride the skyways. Made precisely to scale, the mockup is more important than any plane rolling off today's production line. Yet tomorrow it will be demolished.

problems that might cost millions if mistakes were built into a line of transports. Every assembly in a mackup, like the control unit at right, must be faithful in detail. Manually operated devices are movable, but some instruments are only blueprints showing position.

pictures show details of the mackup's construction.

The mockup resembles in detail the airplane it precedes. It contains duplicates or

photographs of every working assembly and

instrument. Engineers and designers swarm

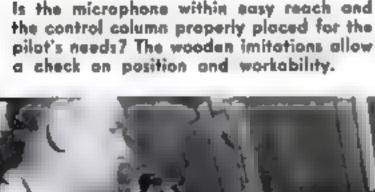

through it for months, remodeling various

installations day by day until at last they

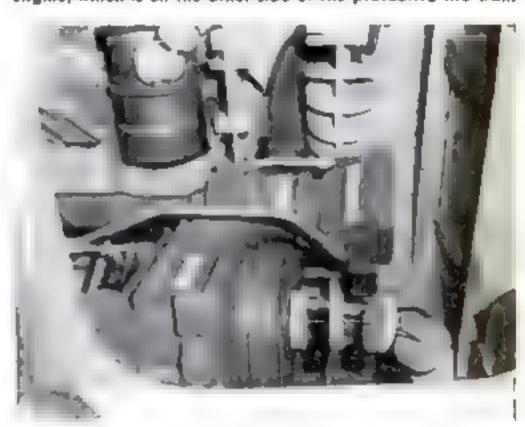

create an air liner that will ply the world's

airways. The precision model, costing \$100,-000 or more, enables engineers to solve

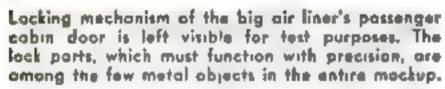

A dummy supercharger unit (below) has round disks of different sizes to represent ducts required by the actual mechanism. Round shaft at the left transmits power from the engine, which is on the other side of the protective fire wall,

Workmen fit parts into a model of the rest room, a segment built separately and then joined to the main structure. This is an example of the section-by-section procedure often used far large airplanes.

Any airplane starts as an idea. This first takes shape as a rough sketch, then progresses to engineering drawings. One of these is a three-view drawing showing external lines, and from it come cutaway paintings, usually in color, showing interior details. With these designs and paintings, the mockup men begin their work.

Sometimes they first build a space mockup, throwing together a skeleton framework with rough floor and paper lining. Into the space mockup go crude counterparts of the baggage compartment, lavatory, powder room, seats and berths, and models of landing gear, wiring and controls. It is all rough, but engineers representing both the manufacturer and the air line get a general picture of the airplane and decide how space is to be allotted.

When the customer has approved the space mockup, engineers proceed with design. Yards of carpeting appear on the floor, a few soft seats are bolted in place, windows are installed, and a workable combination seat-and-berth begins to operate.

As the mockup progresses, the first flying model of the airplane also takes form. This involves considerable trial and error, but engineers find it cheaper to build fast, and correct errors in the plane, than to perfect thousands of drawings.

Physically, a mockup is a simple structure. A transport designer knows that he must allow about four cubic feet of space per passenger for baggage on a transcontinental plane; 200 pounds for each passenger and his baggage; 40 inches for seats, center to center, and an aisle 18 to 21 inches wide. These are essentials of the passenger cabin. The pilots' cabin must be tailored to their needs just as carefully. They must have at least 10 inches clearance above their heads, and they need a minimum of 13 degrees of downward vision for landings.

To satisfy these requirements, the designer fixes the width of the aisle, locates the flooring at a level where a man 5 feet 10 inches tall can walk without bumping his head, and draws a circle. Then he begins building, section by section.

The mockup department at Douglas Aircraft's big Santa Monica plant, illustrated on these pages, provides an example of the sectional method: The DC-6, outgrowth of the war-famed DC-4, is projected. The circle has been inscribed. The first section to be built is eight feet long. Into this go flooring, seats and windows. It looks good to the engineers, so the pilots' compartment, based upon another circle but tapering to the nose, is added.

The entire mockup now begins to rise on scaffolding at the height of the completed airplane. Nonwarping spruce and white pine plywood form the shell, and steel spars extend outward to support the wings and en-

Another example of sectional construction is the baggage compartment, built separately to facilitate tests of a new monorail loading system using a preloaded luggage carrier. The carrier can be pushed inside the compartment (above) and then shoved sideways, forward or aft by means of overhead tracks and a switching mechanism. The mackup makes minar changes in such a system easy and helps iron out flaws.

gines. Wooden engines are fitted into the nacelles. Accessories are installed, removed, refitted. Pilots sit in the cockpit to study instruments and move controls. "Passengers" file in and out to test loading and unloading time—even the time required to serve meals.

Lockheed's mockup of the Constellation cost \$100,000, one-fourth of which went for materials, threefourths for labor. Counting alterations, the same company spent nearly \$200,000 on the mockup for its enormous Constitution, which will soon make its first flight.

Perhaps \$200,000 sounds like a high price for dummy airplanes, but these are worth it. They save millions of dollars and bring a new transport off the assembly line months earlier than if the job had been done with metal. They allow executives to see what they're getting, and no air line orders a new plane from drawings alone.

Designers speak of the planes they build as having short, medium or long range; as being day or sleeper versions, perhaps de luxe with bar; as fast or slow. According to Lew Brown, Lockheed's mockup engineer, the mockup men describe them differently. "We," he says, "turn out squeezers, boozers, snoozers and dozers."

Riding on a four-wheeled eart, shown above, the baggage corner starts its trip up a track and into the compartment. Exterior and interior tracks are aluminum, another exception to the general rule of using wood.

Interior of the mockup for Lackheed's Constellation illustrates progressive stages in the construction of seats and berths. Engineers, above, try out first rough installations for size to ascertain proper chair space and the headroom necessary in an upper berth. Later, a real berth (below) is installed to permit perfection of its operation before it finally takes to the air.

### MORE CAR in LESS SPACE

The hood and front fenders of the Darrin are in one piece (above). Hinged at the front nestend of the rear they are lifted by hydroulic power to permit motor inspection.

The Fiberglas body is unusually low, improving riding qualities. The convertible model shown carries five passengers; three in front, two in the rear. The turning radius is 20 feet.

#### The new Darrin saves 600 pounds by novel design.

FOR 20 years crack designer Howard Darrin engineered cars for the big manufacturers—and dreamed of producing his own. Now his dream has come true in a new superlight car of novel design, with a plastic body and hydraulically powered labor-saving gadgets

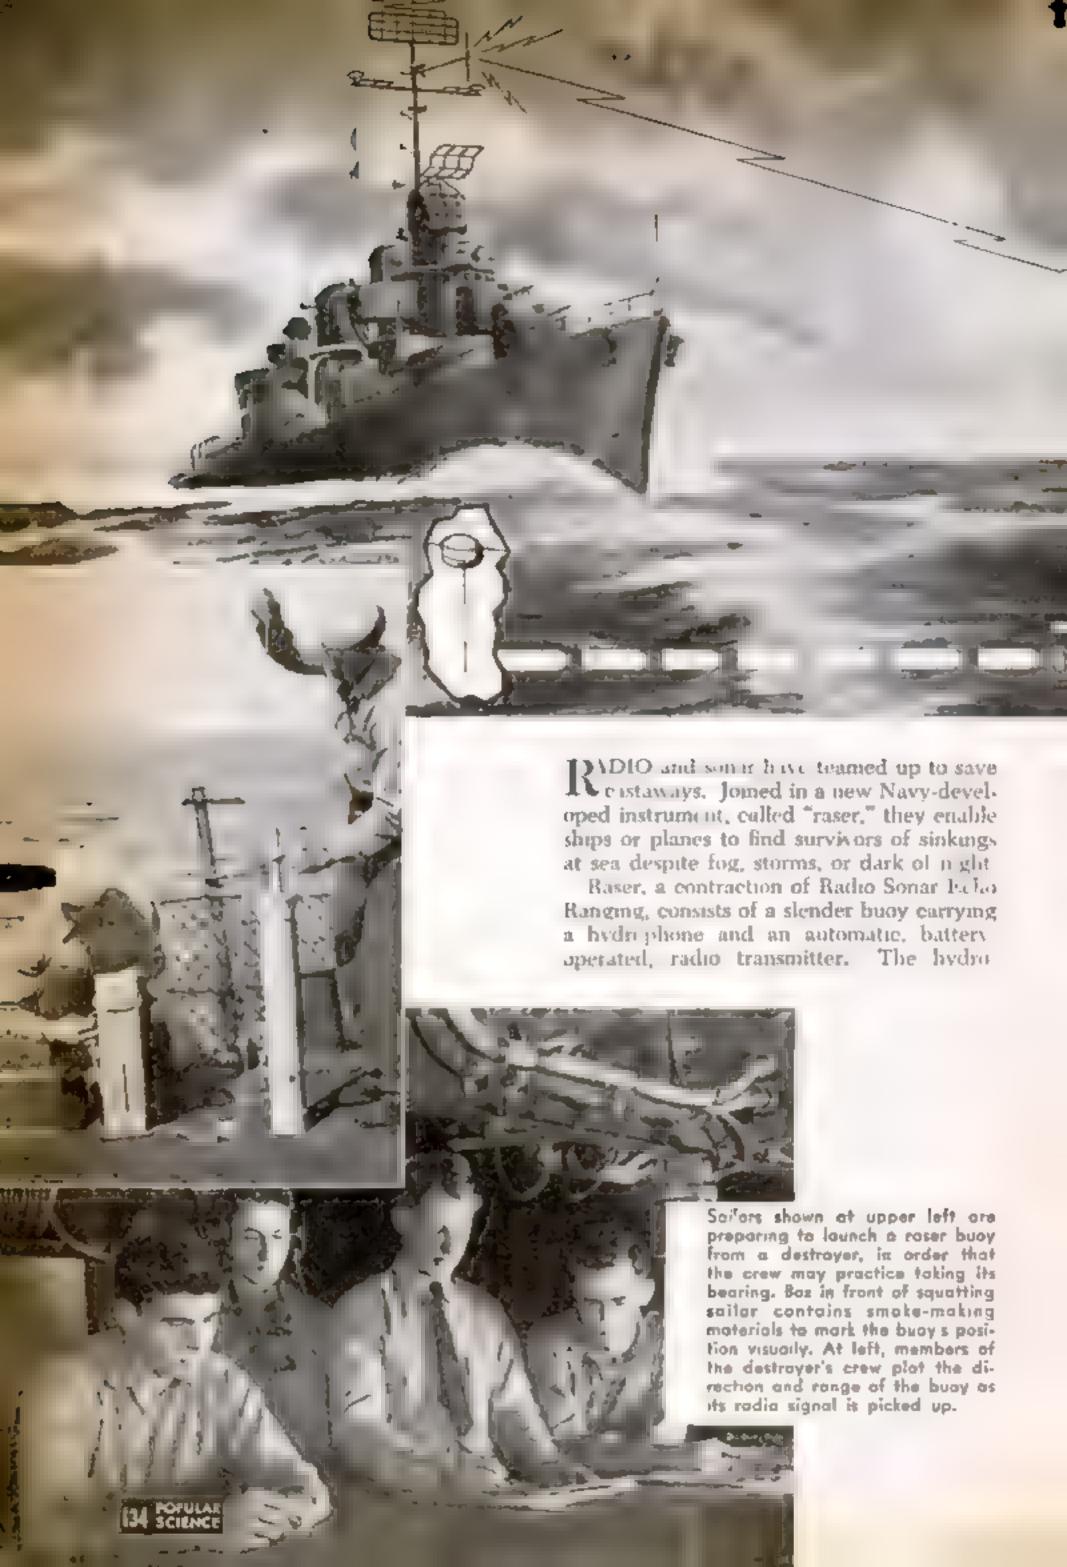

By careful design Darrin has cut the weight of his dream car from the usual 30 to 24 pounds per horsepower. Six inches trimmed from normal height and width save pounds—and gasohne—while bringing the center of gravity down to mid-axle. To permit three to sit comfortably in front, the 60-inch seat is extended to the extreme outer edge of the car. The 115-inch wheelbase carries a 185-inch body

Hayes Manufacturing Company will build the body of unstressed, removable panels of Fiberglas. Four stampings are used instead of the usual 15. The curved windshield is a single unit. The chassis is rectangular, its box-section siderails, which form part of the outside structure of the car, serving as side bumpers. The front wheels are individually spring on torsion bars with wishbone upper arms and I-beam section lower arms. In the rear, the drive is carried through semi-elliptic springs.

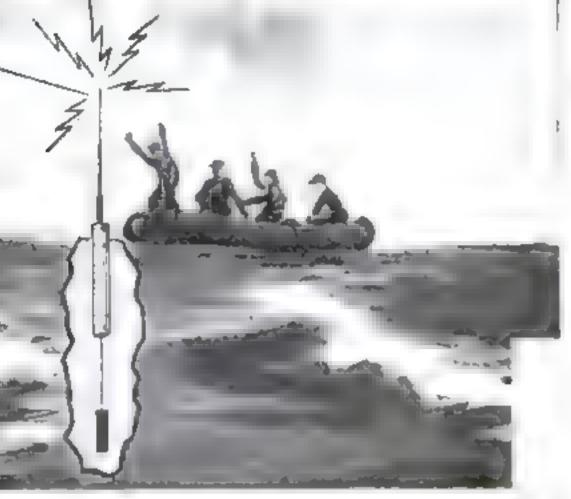

Hydraulic systems operate windows, erect top, lift hood, adjust front seat, and drop jacks to hoist the ear for tire repairs.

An outstanding feature is the use of standard parts and equipment. The power package, including a 100-hp. Continental engine, is a separate assembly. An "L"-head valve arrangement is used and the pistons are aluminum.

Darm, who designed the Kaiser-Frazier bodies and the \$6,000 Darm Packard, expects his new car to sell for less than \$2,000, hopes to build 30,000 in 1947.

## RASER to the Rescue

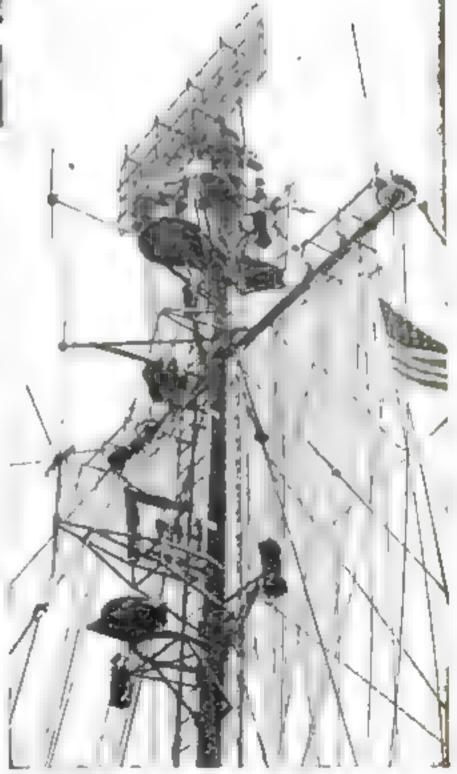

New Navy radio buoy guides sonar-equipped ships by "echo" to castaways adrift at sea.

phone, dangling 24 feet beneath the surface, picks up supersonic sonar signals (PSM, Nov. '45, p. 84) sent out by searching vessels. The transmitter then rebroadcasts the sonar "ping" as a static-free, frequency-modulated signal.

The signal is picked up by the radio of a rescuing ship, demodulated, and fed into the sonar receiver where it sounds much like the echo of a submarine.

By this means, accurate ranges and bearings may be taken on the buoy. Each sonar-equipped ship carries a pattern on transparent celluloid showing its radio antenna's ability to pick up signals from a known source while the ship is making a complete circle. When a raser signal is heard the ship is swung in a circle and the pattern of the incoming signals plotted. In a few seconds the celluloid master pattern is laid over the new pattern, which is marked in compass headings. When the two match, they show instantly the direction of the raser buoy.

The buoy is dropped overboard either from the sinking ship or plane, or from a search plane when its pilot sights the survivors. Ships can pick up the signal 10 miles away and aircraft 70 miles, while trained plotters can guide rescue craft to within 60 feet of the buoy.

A raser buoy's radio acho of the rescue ship's sonar "ping" is picked up on a vertical dipole antenna, seen here (at upper left) projecting like a store's flagpole from the base of a destroyer's radar "bedspring" at her mostheoa.

### AIDS TO MODERN LIVING

A SHOULDER CRADLE manufactured by H. H. Renneker, of San Diego, Calif., gives you the use of both hands while telephoning. With the cradle snugly on the shoulder, the receiver rests against the ear, and is held firmly in place, with the mouthpiece near the lips. The cradle may be installed for either left- or right-ear use and is quickly adjustable to a comfortable position.

FLUORESCENT TUBES have now been adapted to a portable, self-powered light. Known commercially as "Totelite" and manufactured by Paramount Industries, Inc.,

of New York, the 7-lb. light operates on any standard portable B battery and gives illumination over a field of 180 deg. Measuring 4%" by 8%" by 11", the case is made of 24-gauge cold-rolled steel with a transparent plastic shield. Control switches are under the handle.

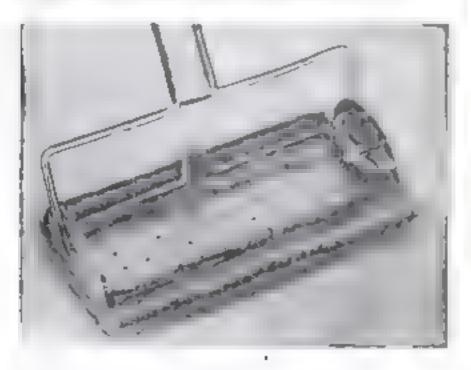

SEVEN TOOLS come in a home kit produced by Standard Pressed Steel Co., of Jenkintown, Pa. A hollow handle, with a chuck at one end, contains a gimlet, and, bottle opener, tack remover, punch, and standard and Phillips screwdrivers.

EXTRA STORAGE for the kitchen is provided by a rolling-door cabinet made by Mullins Manufacturing Corporation, of Warren, Ohio. Designed to fit under standard cabinets where space would otherwise be wasted, it is especially useful for keeping spices, salt and pepper, and other condiments close at hand while food is being prepared. The door, which operates like an old-fashioned roll-top desk, is made of burnished steel strips and stays open or closed without catches. Manufactured in two different widths, 18" and 24", the cabinet has two shelves.

FLOOR CLEANING AND WAXING are both done with the appliance shown below. Steel wool clamped to the perforated plate is used with soap and water for linoleum, tile, wood, and other floors. Then the wool is replaced by cloth or a cellulose sponge and liquid wax is poured on the plate. The maker is Ottoson Product Co., of New York.

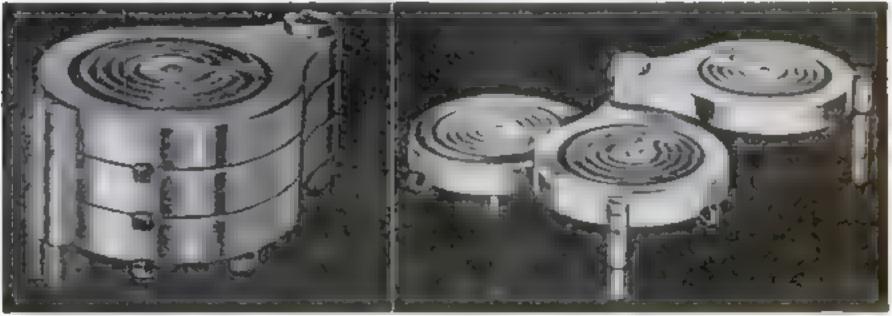

METAL PERFUME DISPENSERS produced by Bolsey Machines Corporation, of New York, lock at both the tip and refill ends to prevent leaks. Sold under the trade name of Parfumex, each dispenser holds 18 drops. Perfume is drawn out by rubbing the tip.

MEAT CAN BE TENDERIZED at home with this device, made by Ebaloy, Inc., of Rockford, Ill. It is equipped with multiple, rotating knives that sever all sinews when they are run over the surface. Construction is such that the blades will go over bones without breaking. A thumbscrew permits taking the tenderizer apart for easy cleaning after it has been used.

THREE DEGREES OF HEAT are provided by a new portable electric stove which unfolds in a cloverleaf design. If desired, the 600-watt top burner may be used alone without unfolding, as at the left below, but when the burners are swung apart three dishes can be prepared simultaneously, the 500-watt mid-

dle burner giving medium heat and the 220watt burner low, or simmering, heat. For safety, automatic switches shut off the lower two when they are closed. Manufactured by Cameo Products, Inc., of New York, the range weighs only 7 lb. and, when folded, is easily carried in a suitcase or bag.

A STAINPROOF WALL COVERING has been developed by United Wallpaper, Inc., of Chicago. Tests show that almost any type of dirt spot or stain can be removed simply by washing with soap and water, while materials such as paint that are not water soluble respond to turpentine. Marketed under the name of "Varlar," it is made by fusing plastic resins and colors on paper or cloth.

A GASOLINE STOVE adapted from the one used by the armed forces during the war is being manufactured by the Coleman Company, Inc., of Wichita, Kan. Standing less than 9" high, the stove uses either white or leaded gasoline.

Crayon sketches drawn by a child are wiped away with turpentine, and the paper is as good as new.

MOTH BALLS are kept inside the hollow arms of a new type of clothes hanger produced by the Moth-Proof Garment Hanger Company, of Corona, N. Y. As shown in the photo at the left, the balls are inserted in the ends of the arms. This gives protection to garments in steady use as well as to those put away until the next season.

**HOT-WATER TANKS** often are ruined by corrosion in only a few years, particularly in areas where the water supply is acid. In the new Clark electric heaters, a 24" bar of magnesium forms with the steel and hot water a big galvanic battery, giving corrosion protection through an electrolytic action that keeps plating the inside of the tank with magnesium, as indicated by the arrows at the left. While developing this system, research workers of the McGraw Electric Company, of Chicago, discovered that the magnesium anode would be eaten away in only a few months, however. To reduce the current flow and make the magnesium last for years, the rod was insulated from its steel cap and the current flow reduced by a small resistor, as indicated in the cut-away sketch at the right. This gives protection, yet meters the flow of magnesium ions. The invention is known commercially as the Clark "Ionodic" system.

138 SCIENCE

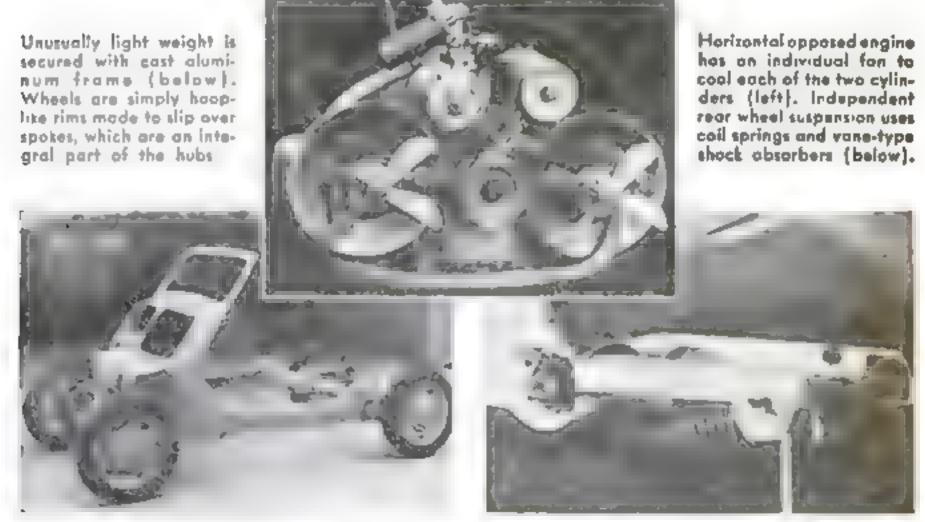

Roomy for its size, the 800-lb. French "Gregoire" is a two-door convertible sedan. Top speed is 60 m.p.h.

## Aluminum Car Weighs Only 800 lb.

WITH a total weight of only 800 lb., this new European light car boasts a cast aluminum body, top speed of 60 m.p.h., and high fuel economy—65 miles per gal. The French "Gregoire," named after its designer, Jean Gregoire, has a convertible top, front-wheel drive, and is powered by an air-cooled, horizontal opposed two-cylinder engine.

Planned in 1940, the first model was built secretly during the German occupation. Production in France is expected to be started shortly by Aluminum Francais, while American rights have been purchased by Henry Kaiser interests, which are reported planning adaptation of "Gregoire" design features to their own front-wheel drive model.

### GUS Wilson Delivers a K.O.

#### By MARTIN BUNN

STAN HICKS rushed into the Model Garage shop, his eyes as big as brake drums. "Hey, boss!" he said breath-lessly to Gus Wilson. "Jack Cross is outside in a big sporty coupe! He wants to see you!"

Gus grinned tolerantly at the grease monkey. He was a boxing fan himself, and he understood the thrill Stan got out of being spoken to by our town's only famous

prize fighter.

Jack Cross never won the welterweight crown, but he came within a second of it the night 10 years ago when he had the champ stretched on the canvas and the gong clanged at the count of nine. He was still rated as a hazard any youngster had to pass before he could get a crack at the title.

"I'm going to see him fight Buzz Billings tonight," Gus said with deliberate non-chalance. "In their last scrap Buzz had him in trouble, but Jack knew too much for him and won the decision. Tell him to drive in."

"But, boss," Stan gasped. "It's Jack Cross!

Hadn't you better go out?"

"Scram," Gus laughed. "I've known Jack Cross since you were in three-cornered

pants,"

A moment later a flashy, newly painted coupe of the late '30's was driven in, and a solidly built man climbed out and swung over to Gus with his hand extended. His face was scarred, his nose was crooked, one ear was thickened, his wide smile displayed expensive and extensive bridgework, but when he spoke his voice was surprisingly gentle.

"Hello, there, Gus," he greeted. "Haven't seen you since Napoleon was a corporal. What do you think of this jalopy I bought?"

Gus eyed the coupe. "It was a good car," he said, "but I can't tell if it still is."

There was a bitter note in Cross's laugh. Like me, isn't it? Did you see me in there with Buzz Billings last month?"

"Sure," Gus told him. "I was rooting for you, but you had me worned for a while."

"You were worned!" the fighter said, his smile vanishing. "How do you think I felt? I'm fighting him again tonight, but maybe I oughtn't to. It may be time for me to quit—I don't want to end up by walking on my heels and telling people I'm training to fight

Mickey Walker. Buzz hurt me with that right, Gus. I've been hearing funny noises since he smacked me with it—and I want you to tell me whether they're in this car or in my head."

Gus stared. "Trying to kid me, Jack?" Cross shook his head. "I never felt less like kidding in my life," he said grimly.

"O. K," Cus told him. "What's this about noises? When did you first hear them?"

"The first time I drove the car," Cross replied. "I bought it from a dealer in the city and had him recondition it."

"That proves the noises are in the car and

not in your head," Gus reasoned.

"No, it doesn't," Cross disagreed. "They dehvered the car the morning after the fight,"

"You must know," Gus argued, "whether the car made the noises before you

bought it."

"I never drove it before I bought it," Cross admitted. "My old bus had to be junked, and I took the salesman's word that this one would be thoroughly reconditioned. The morning after the fight I wanted a vacation. I phoned the dealer to send the car around to the hotel, and I started to drive it down to Atlantic City. In about a block I began to hear the noise—a sort of low tick-tick-tick. When I got out on the road and speeded up it got louder, and the ticks began to come closer together until the noise was pretty near continuous."

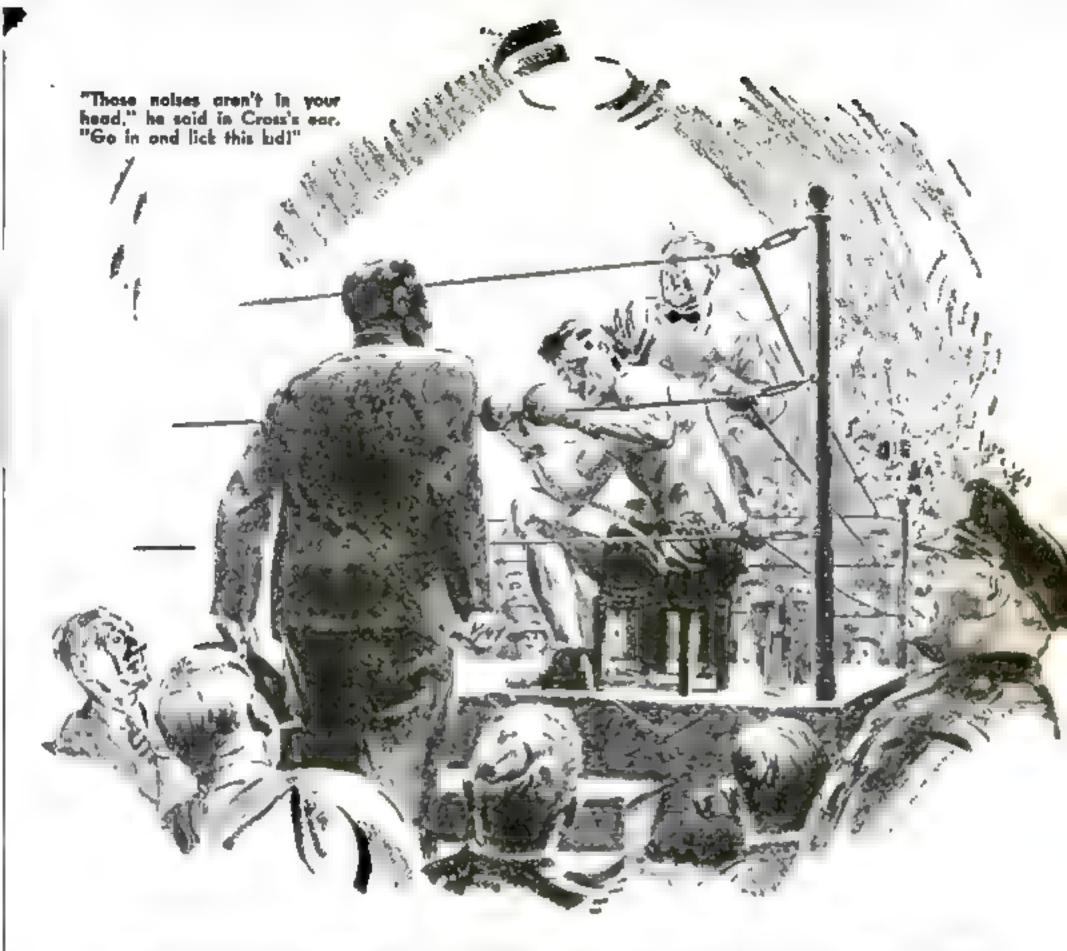

"What did you do?" Gus asked.

"After I had listened to the noise for about an hour," the boxer told him, "it began to get on my nerves, so I stopped at a garage. The mechanic said that the speed-ometer cable was shot and put in a new one. But I heard the noise again as soon as I got out on the road. I stopped at another garage. That fellow said it was caused by a wheel bearing and spent an hour putting in a new one. But the noise got louder and louder, and after I'd gotten to Atlantic City and checked in at the hotel I kept on hearing it—all night."

"I've had the same thing happen to me,"

Gus put in. "Just nerves."

"You think so?" Cross asked. "Listen to the rest of it. Next day I took my bus to a big repair shop. I got it back in two days with a big bill and a song and dance about the transmission—and the tick was still there.

Driving back from Atlantic City, it sounded sometimes as if it was in one part of the car and sometimes in another, and after an hour I was sure it was in my head. When I got to the city I took the car to the place I'd bought it. The manager drove with me for a block and said I was imagining things."

Gus scowled.

"I was so scared I couldn't say anything," Cross went on. "Since then I've kept on hearing the noise—in the car and out of it—but I haven't told anyone but you. Maybe I shouldn't fight Buzz again—they're building the kid up and figure he'll kayo me. You know your business, Gus, and I know you're on the level. Locate that noise and cure it, and I'll know I'm all right. If you say there's no noise, I'll know I've taken too many punches."

"That's easy to decide," Gus told him.

"Hop in, and we'll take a ride."

Cross looked at the shop clock. "I can't-

I've got to get down to the city," he said.
"My manager's waiting outside. Keep the car, and I'll be in tomorrow. Coming to the scrap tonight? Win or lose, it'll be my last. I'd like to wind up with a win, but I'm not going to give Buzz a chance to nail me with that right again—not with me hearing funny noises in my head!"

"Sure, I'm going to the fight," Gus laughed. "And forget the noises. I'll prove they're in the car and not in your head."

AFTER Cross had hurried out, Gus jumped into the coupe and headed up the highway. He heard the noise at once—a well-spaced tick-tick-tick that grew louder when he increased speed and became a fast, loud buzz when he worked it up to 50. At first it sounded as if it came from the transmission, then from the rear end, then from the front wheels.

"The noise is there, just the way Jack

heard it," he told Stan when he got back.
"But finding the cause may take quite a while. If I could tell Jack what it is before he goes into the ring it would ease his mind and maybe help him win. Let's get busy!"

Working quickly but carefully, he checked and rechecked—but after an hour the source

of the noise still was unfound.

"We're not getting anywhere," Gus said.
 He lighted his pipe and blew clouds of gray-blue smoke as he stared at the coupe and dug into his memory for the cause of each mysterious car noise he'd had to run down.

"That could be it," he muttered after five minutes of concentration. "It must be it.... Hey, Stan-forget your dinner and help me

pull off this torque-tube assembly."

It was a long job, but when it was finished

Gus grinned with satisfaction.

"There's what made Jack Cross think he was going nuts," he told Stan, pointing to the taper pin which in that car holds the drive shaft to the driving pinion in the rear end. "The pin is driven tight at the factory but sometimes works loose the way this one did. It can't drop out because of the torque tube, so the shaft still drives the gear, but the rotating pin strikes the tube and makes a ticking noise that is so hard to locate that most mechanics miss it"

He pulled out the loose pin, examined the taper hole in which it had been seated, and

checked the torque tube.

"That's good," he told Stan. "The hole hasn't worn, so all we have to do is drive the pin back good and hard. Sometimes a pin cuts a groove so deep you have to install a new tube."

"I get you-I guess," the youth muttered.

Gus climbed into his own old roadster. "Jump in," he called to Stan. "I'll buy you a ticket to the fight."

BUT they had worked so long, the Cross-Billings bout had gone six rounds by the time they reached the arena.

"How's it going?" Gus asked the man next to him as the gong sounded for the seventh.

"Billings all the way," he was told. "Cross seems to be washed up."

Gus watched as Cross

came out of his corner. He was brisk enough but painfully cautious, constantly circling to his right in an obvious attempt to keep out of range of his opponent's Sunday punch. Billings, confidently aggressive, snapped the veteran's head back with stinging left jabs.

It was that way all through the seventh and eighth rounds. Only Gus knew that Cross was worried sick by fear of becom-

ing punch drunk.

"If I could only tell him!" Gus muttered. In the ninth, he could stand it no longer and began to work his way toward the ring. An usher ordered him back, but he kept going. He got to Cross's corner as the round ended. A cop grabbed at him and missed.

"Jack!" he yelled. "I've got to talk to you!"
Cross, sitting dejectedly on his stool, recognized his voice above the roar. He turned, saw Gus, and said something to a second, who beckoned. Gus climbed the ring steps.

"Those noises aren't in your head," he said in Cross's ear. "They're in your car-a loose pin. That's on the level, Jack. You aren't getting punchy. Forget it—and go in and lick this kid!"

The veteran's cut lips twisted in a grin, and he managed a wink with a puffed eye. "Thanks, Gus," he muttered. "Watch me."

The gong clanged. They met in mid-ring and touched gloves in the traditional final-round handshake. Then, his right cocked and his extended left ready, Buzz glided forward, expecting to tag Cross with another jab as he circled away from his right. But this time Jack didn't circle. He stood firm, His left flashed out, and his glove smacked into the pit of his opponent's stomach,

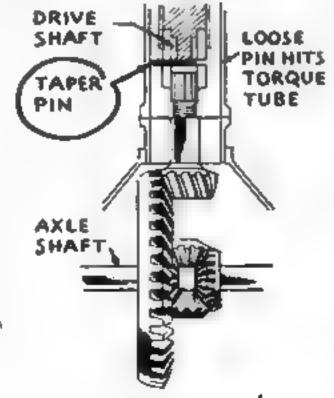

Buzz gasped, and he doubled over and

tried to wrap his arms around Cross. But Jack slid back—then forward again—and let go his right. The punch landed on the side of Buzz's jaw. His knees buckled, and he pitched forward on his face.

The referee's arm rose and fell with the count.
"... eight ... nine ... ten!" He grabbed Jack's right hand and held it up.
"The winnah-- Jack Cross!"

Jack grinned crookedly at Gus. "I get the credit, but you won the fight."

"O. K.," Gus said. "I'll put it on the bill."

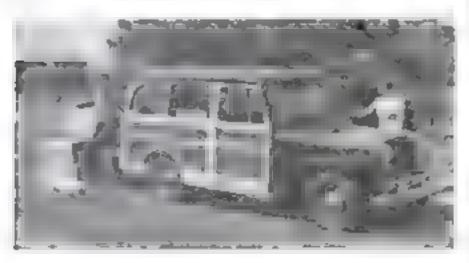

The pin is driven tight at the factory but sometimes works loose.

PREVENTION OF GAS LOSS through spilling and evaporation when the tank is being filled is the object of an air-pressure relief pipe leading from the tank to the filler pipe on the new 1947 Studebakers. The relief pipe releases air that would otherwise cause the gasoline to foam and gurgle as the level rises in the tank. It was designed after a study of waste from this cause.

JEEP STATION WAGONS have joined the Willys-Overland procession of jeeps revamped for civilian uses. This model has an all-steel body, the 63-hp, jeep engine, and a new chassis and running gear. The body is finished to resemble mahogany and maple, but the only wood used in construction is maple for floor runners to facilitate

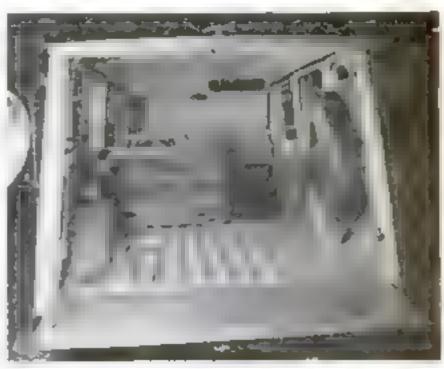

arrow that lights up on the back of the car when the driver flicks a switch attached to the steering post or on the instrument board. The accessory is manufactured by the U.S. Metal Products Co., of Brooklyn, N.Y.

NEW LIGHTWEIGHT TOW CABLES are equipped with clamping jaws that can be attached to the bumper simply by tightening a wing nut. A woman can easily put one on. The cables are galvanized as a protection against rust and come in three sizes, with minimum breaking strength of about 2,000 lb. for the smallest size. They are a product of the Wind Turbine Company, of West Chester, Pa.

loading and unloading. Removable, waterproof seats will carry six riders besides the driver. The interior can be hosed clean.

O'IL costs money, and no one wants to waste it, but many of the war-weary cars now on our highways consume it like a fuel. If your car is in this oil-hungry class, it's a pretty safe bet that your rungs, pistons, bearings, or valves are faulty, or you go too fast for the age of the car. But even if you should pay out good money for a ring job, you might discover later that you need as much oil as before. How this can happen is intricately involved with the many reasons for high oil consumption.

Oil is not simply a lubricant, as many persons think. Automotive engineers have determined that about nine tenths of its job consists of helping keep the engine cool. Reduction of friction is only one tenth.

This heat-removal function helps explain high oil consumption. When an engine heats up because of high operating speed, abnormal atmospheric temperatures, or a dirty cooling system, a heavier burden is thrust upon the oil. Heat thins all oils. Consequently, in old engines with loose bearings, more oil is thrown to the pistons. If these are loose and the rings worn, oil gets by and burns in the cylinders. Loose intakevalve stems and clogged rings also cost oil.

The relationship betwen speed and the amount of oil consumed was demonstrated a few years ago. Several cars were driven a certain distance at 30 m.p.h. Then the same cars were driven the same distance at 55 m.p.h. At the higher speed, the oil consumed by the individual cars was 2% to 19 times greater than at the lower speed, the average being seven times greater.

In the case of the car that consumed on at a rate 19 times faster, it's simple to see how a driver, accustomed to the car's lowspeed oil consumption, could burn out a bearing in short order. There are two very simple precautions that you can take to prevent such damage. Check the crankcase oil level every time you buy gasoline, or more often if you are driving far and fast, and keep a watch on the oil-pressure gauge.

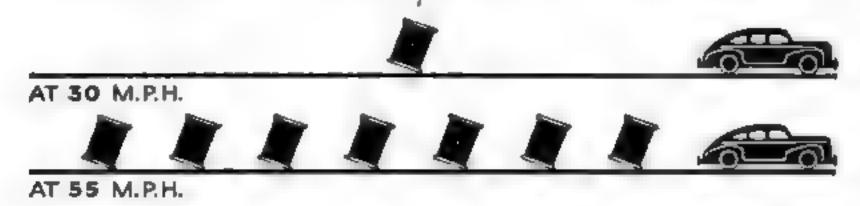

In a memorandum issued to its dealers, the Socony-Vacuum company lists the mechanical condition of the engine, driving speed, operating temperatures, and the type and grade of oil as the major factors controlling the rate of oil consumption. The memorandum observed that poor mechanical condition of engines has caused a large increase in oil use since the war ended.

In old cars, oil is apt to be wastefully burned in the combustion chamber. If oil-control rings or drain-back holes in the piston are clogged, the rings will allow oil to pass into the chamber instead of forcing it back to the crankcase. If rings are worn, sluggish, or stuck, they will not carry out their job of sealing off the combustion zone from the crankcase region; as a result, the suction stroke will carry oil into the combustion chamber and hot blow-by gases will rush down the cylinder walls on the return stroke, contaminating the crankcase oil.

Motorists sometimes have noticed that their oil consumption is reasonable up to a certain speed while beyond that their cars become the worst type of oil hog. When such a condition occurs, the compression and oil rings usually have lost part of their wall pressure. At low speeds, this makes little difference, but when the engine operates faster the rings bounce, or "flutter" as the ring makers say, allowing oil to get into the compression chamber.

A similar oil waste may result from collapsed piston skirts, worn intake and exhaust valves, worn valve guides, and worn, scored, scuffed, or distorted cylinder walls.

#### HOW SPEED AFFECTS OIL CONSUMPTION

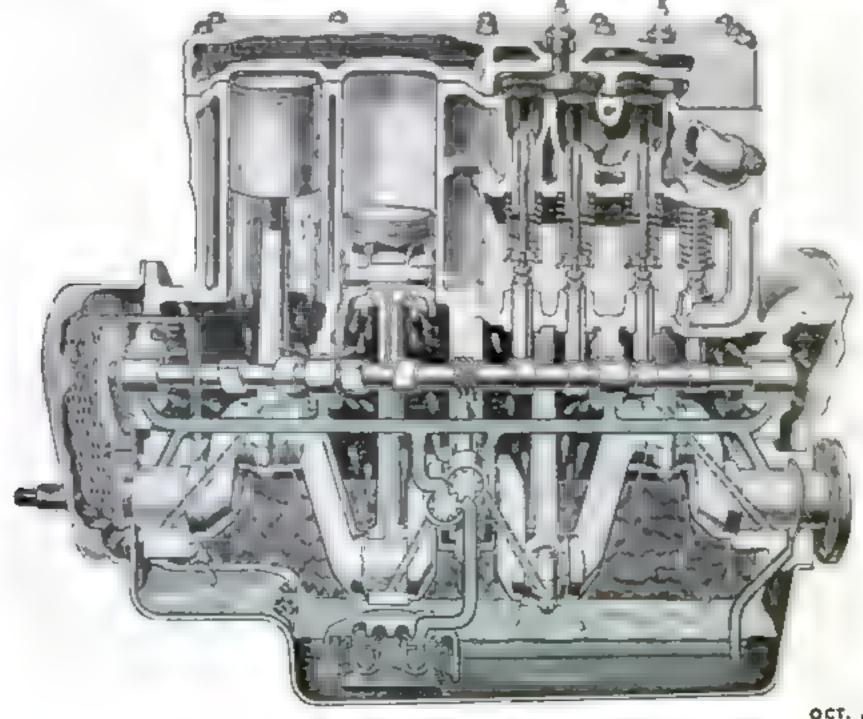

In actual tests, the same cars used seven times as much oil at a 55-m.p.h. overage as they did at 30 m.p.h.

No one would blame you for complaining if your car should use as much, or more, oil after an overhaul. But this has happened, and the explanation is simple. Unless the mechanic exercises care, the act of tightening a cylinder head can distort the engine block sufficiently to force the cylinders out-of-round so the rings cannot form a seal.

Cylinder heads should be installed with strict attention to the manufacturer's instructions. This entails not only the tightening of hold-down bolts in a definite order, but pulling them down a definite amount with a torque wrench.

Unsatisfactory results also may follow a ring overhaul unless the entire lubricating system is properly balanced. The oil pump is the key to distribution of the correct amount of oil to each vital bearing surface of an engine. A faulty pump or clogged screen may starve the bearings and cylinders. When the main bearings become worn,

In modern care, all Rows through a complicated system. For all economy, each part must work properly.

OCT. 145

#### FIVE WAYS TO PREVENT OIL TROUBLE

Don't drive an old car at the speed it was capable of when new. Wear in the engine parts of such a car shows up promptly in its oil demands at high speeds.

2 Train yourself to observe the cil-pressure gauge at frequent intervals while you are driving. If the pressure drops off, stop at once and check the oil.

Carrying a spare can of ail in your car is good insurance against a burned bearing ar other costly trouble. The few extra miles when you run out of ail in an isolated spat could do the damage before you reach a gas station.

4 Check the oil each time you get gas. Use the grade and type recommended for your car.

5 Make the exhaust-pipe test with your finger, if the pipe has oily deposits, the rings, pistons, or valves need attention. If it is clean and dry, any oil loss may be due to leaks.

oil leaks away there and the bearings in the connecting rods may suffer. When these are worn, excess oil floods the cylinders, the oil control rings cannot function properly, and much of the excess oil finds its way quickly into the combustion chamber.

Leaks to the ground account for a heavy loss of oil. It has been computed that one drop spattered on the highway each 100' will add up to a full quart of oil in 200 miles. Leaks may occur around loose or worn gaskets, faulty threads on an oil drain plug, a loose drain plug, a damaged fuel-pump diaphragm, or through internal or external cracks.

While every autoist knows that the crankcase oil should be kept at the prescribed level, the reasons why are less well known. If it is low, a smaller volume is available to dissipate engine heat, oxidation occurs faster, and sludge or varnish deposits build up more quickly. Too much oil also is bad economy. In that case, the oil, churned by the crankshaft and connecting rods, overloads the rings to such an extent that they can not limit the amount reaching the upper cylinder zone. It also is important that you use oil of the grade recommended for your car. Oils with too heavy a body are more difficult to circulate and consequently raise the temperature. Those that are too light will not perform the tasks of lubrication and heat removal they are supposed to do, and are more apt to be lost through leakage.

You'd hardly expect to have oil economy if your pistons are in the condition of the one at the left. It indicates what happens when the rings become stuck.

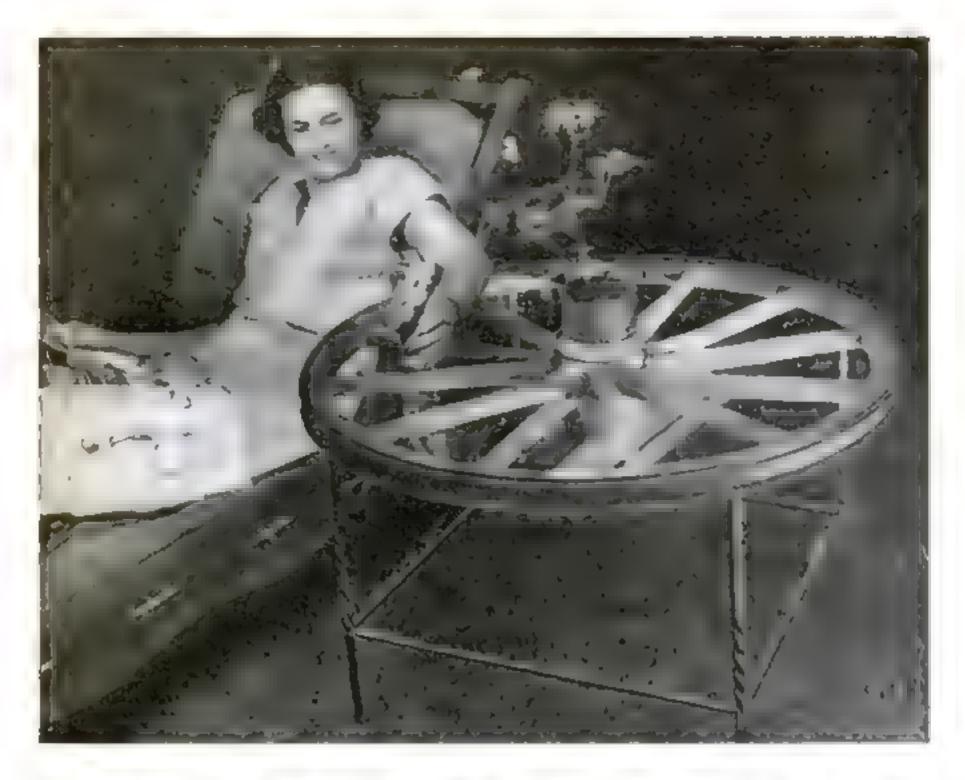

Carbon deposits are evident on these valves, while their shiny stems suggest wear in the valve guides. Such a condition wastes oil in the combustion chamber.

# Turn Wagon Wheels to Profit

IF YOU have or can get some wagon wheels, there are a whole wagonload of uses to which you can turn them. Although such wheels are fast entering the limbo of the bustle and the whale-oil lamp, they can still be found in farm yards, old stables, and

junk yards. Made by master craftsmen, and often out of choice woods, they would be costly to duplicate. Many are of graceful and pleasing proportions.

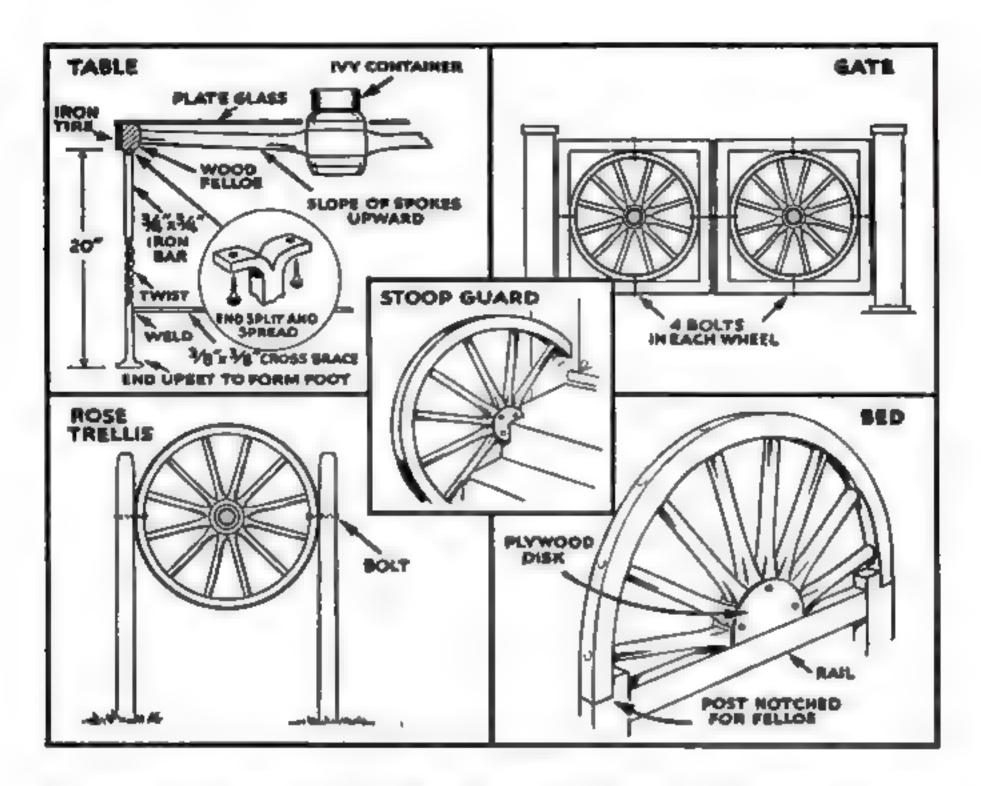

Shown in the accompanying illustrations are only a few of the interesting things that

can be made from wagon wheels. Paint may be removed, and wax or varnish applied to bring out the natural color of the wood, or gay colors may be used.

The table shown has a round glass top with a hole for the hub cut to order by a glazier. The center hole adds to the cost of the glass, and can be avoided if the hub

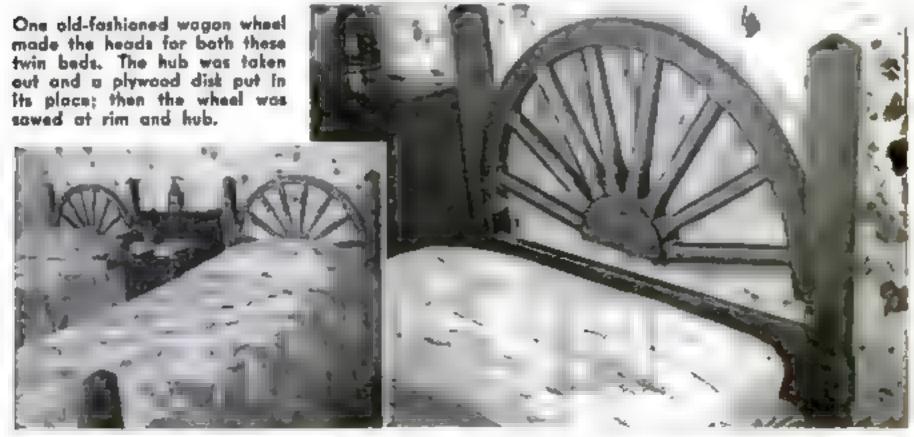

Wagan wheels bolted between posts make a fence that will become a rustic landmark.

is unbolted and removed. A plywood disk can then be nailed in to replace it, as on the heads of the beds shown. Fit the glass to the outer edge of the tire unless the fellow is recessed, in which case it should fit inside the tire.

Wheels are bolted between posts for trel-

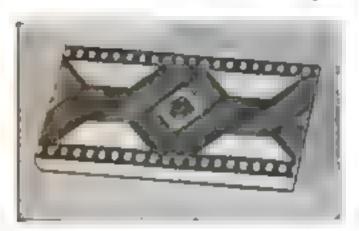

lises and fences and in frames for a gate. One long boit may hold two wheels to a fence post between them, but it may be easier to bolt one wheel at a time and use another bolt higher or lower for the second wheel. A quarter segment is sawed out of the stoop handrail.—Eric Sloane.

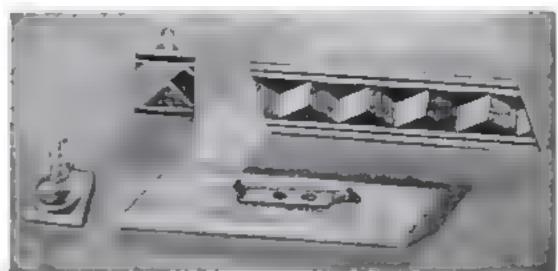

#### Costume Jewelry from Scrap Inlay Strips

HERE is something you can do with leftover inlay strips and make a hit with the women in your family. Glued to thin wood and equipped with pins or earring clips, the strips become bright costume jewelry, as shown here and in color on page 112.

Discarded Venetian-blind slats were used for the backing of these lapel pms and earrings. Glue the inlay on the backing, cut to size, and sand and varnish. Fasteners can be held to the wood with household or model-airplane cement if the metal is cleaned thoroughly of oil and grease. It is not necessary to sand paint off the backing stock to make it adhere.—George R. Jones.

#### Plane Engine Is Novel Necktie Rack

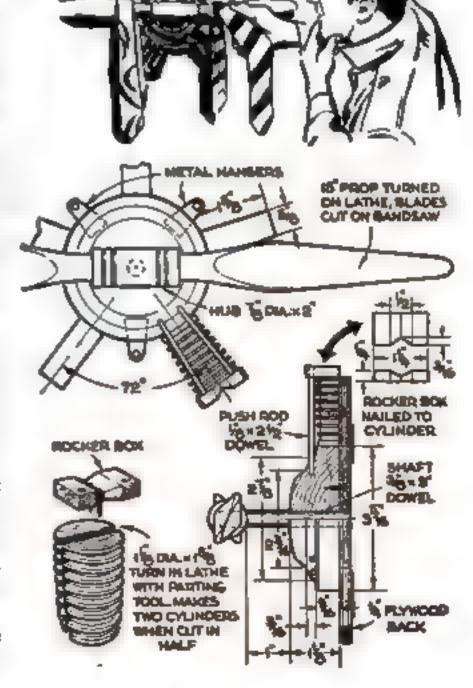

Africant enthusiasts who also like to make things of wood will enjoy working on this novelty tie rack. Six to eight neckties can be kept in full display on the propeller blades, or more if you don't mind thumbing through in making selections.

Turn the crankcase on the lathe faceplate, saw out of X" plywood a backing piece having five equally spaced %" by 1%" arms, and assemble with screws. The five cylinders can be turned from 1%" dowel and the fins made with a parting tool. Only three need be turned, for each will make two cylinders for the project when cut in half.

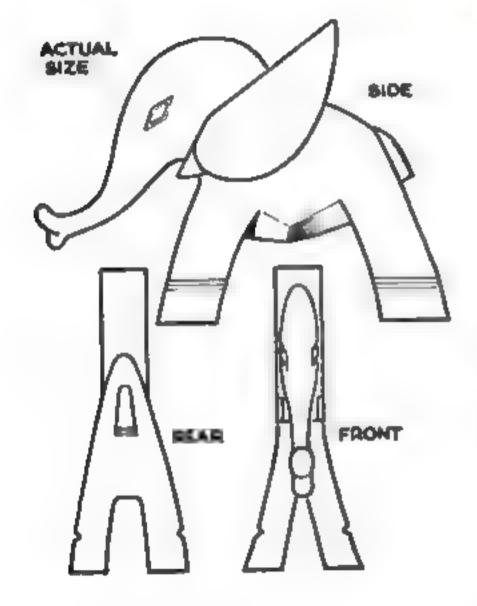

If X" dowels for the push rods are not available at a model-supply house, lollipop sticks can be substituted. Assemble the cylinders, rods, and rocker boxes on the crankcase and back with glue, screws, and brads.

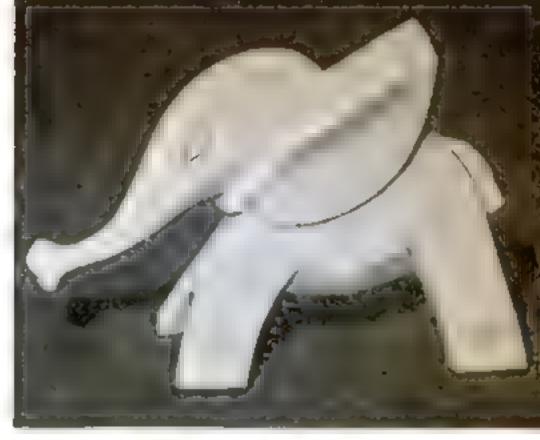

The propeller blades and hub are turned as one piece with a maximum diameter of 1%" at the wide part of the blades. Flatten the blades on a bandsaw or by carving and mount with glue on a %" dowel shaft. A small block glued behind the tip of each blade will keep ties from sliding off.

Finish the engine and shaft black and the prop with alumnum paint.—Joe Zesnowski.

### WHITTLE IT FROM SOAP

By JUEL F. ALSTAD

O'NE of the simplest and least demanding materials for carving is common hand soop. It's cheap, too—scraps whittled from a bar can be saved and used for washing clothes and dishes, and the carving itself, if it should be ruined by a slip of the knife, is still useful in the bathroom. Of course, if you turn out a masterpiece, you may want to preserve the carving as a mantel ornament.

Among the pieces that can be carved after a little practice are ivorylike statuettes, toy zoo animals, Christmas-tree ornaments, novel place cards, and personalized gifts and souvenirs. Silhouettes and cameos that turn out well can be attached to tin foil or paper backing with water glass (sodium silicate) and hung like plaques. Pieces may be colored with poster or other water colors, but don't brush so hard that the soap lathers.

Rectangular white bars that are fresh and evenly soft-textured are best. Two or more

Lay a paper pattern on a bar of soop and trace the figure with an arange stick; then pare off the excess, working toward you, to rough the piece to shape. Curves are scraped smooth with the edge of the knife.

may be joined for a large carving by soaking the sides until they soften and pressing them firmly together. It is wisest to begin with small figures until you get the knack.

A paring knife or jackknife will do all the carving. Draw the figure on paper and trace it on one side of the bar with an orange stick or a blunt pencil. No carbon is used. Rough the figure to shape by paring, making the piece generously large for finish shaping. Then scrape it down to final shape and size with the edge of the knife. Nicks may be

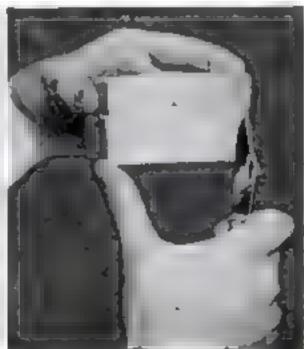

worked out by using the blade flat, and gouges filled by fitting in wetted pieces.

Carve by working the knife toward you to avoid breaking off projecting parts. Unlike whittling wood, it is best to finish one side and match the other to it. Separations such as between legs can be made by working the point of the knife down gently. Slender portions are rounded with the point. Finish with a moistened cloth, rubbing the whole figure gently to give it a sheen and work out nicked spots.

Separations between the legs are made by pressing the trife point down gently. Nicks and ridges can be smoothed with a moist cloth. Two or more cakes may be soaked and pressed together for large carvings.

INSTALLING a basketball backboard for the kids frequently means a compromise between utility and preserving the appearance of your property. This one, on a demountable frame equipped with large casters, adds the driveway to the playing area. The crossbar should clear players' heads.—E. A. RERUCHA.

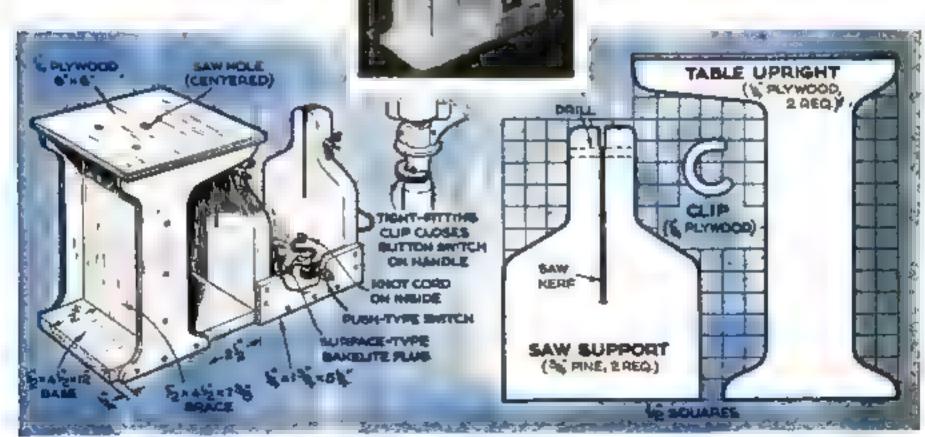

#### Table Stand Adds Accuracy to Vibrating Electric Coping Saw

CRAFTSMEN who use a vibrating electric coping saw sometimes find the vibration transmitted to small work when the saw is held by hand. A table and stand will improve the accuracy of fine cuts in model-making, jewelry work, and the like. By loos-

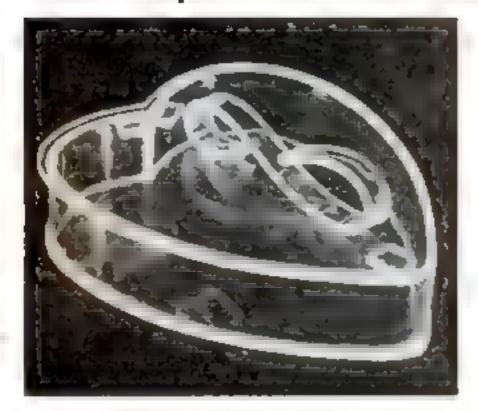

ening the wing nuts the saw is quickly removed when needed as a hand tool.

Make the base, the saw supports, and brace of pine, and the table and other parts of plywood. The supports are notched 3/64" wide by X" deep to receive the saw frame, and the notch is extended downward about 3X" with a single saw kerf to permit some take-up that will clamp the saw tightly. A X" saw hole in the table should allow blade

movement without binding when pressure is applied in operation. Make sure the table is square with the supports, Assemble with glue and with countersunk screws.—JOHN J. GALLIVAN.

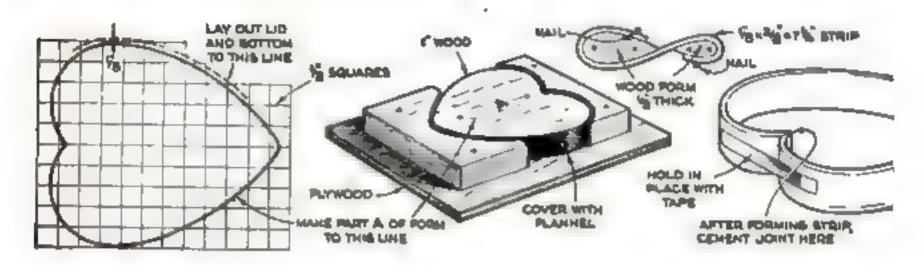

#### Heart-Shaped Plastic Jewel Case Shows Contents at a Glance

CLEAR, crystal-like plastic has a sparkle that makes it ideal for a jewel case. Saw the top and bottom of the box to shape with a jigsaw or coping saw and file or sand the edges. The side and handle are heated one at a time in an ordinary oven for three minutes at a temperature of 220 deg, or till quite pliable, removed with gloved hands, and bent to shape. A simple jig will help in forming the side.

Cement the ends of the side together and tape until the cement sets, and then cement the side to the bottom. File flats on the handle and cement it. Put the top in place, mark for stops with a glass-marking crayon, and cement them on.—JOHN A. VINCENTI.

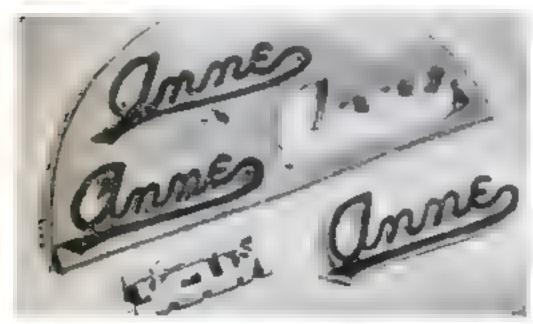

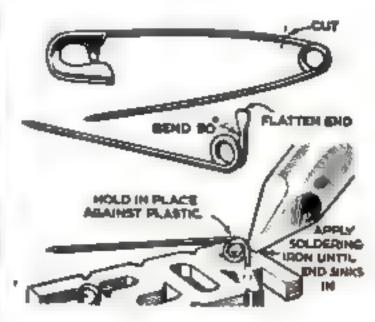

#### Jigsawed Plastic Lapel Pins Bear Girls' Names in Script

SCRAP pieces of clear plastic about %" thick, some masking tape, and a jigsaw can be the means of turning out personalized, ornamental pins to delight feminine hearts.

Tape both sides of the plastic and write the name on one side in full, rounded letters. Drill 1/32" holes where necessary for interior cuts, as at top left in the photo, and make the inside cuts first, as at the bottom left. Use a .020" thick, .070" wide, 32-tooth metal-cutting blade. This is important because coarser blades chip the material, thinner blades break, and wider ones will not turn in their own radius. If your jigsaw has variable speeds, run it at about 1,400 r.p.m.

Remove the tape and attach the pin to the back. A safety pin with part of the back cut away serves. Flatten the short end, hold with pliers, and touch the loop with a hot soldering iron.—J. Douglas Bates.

# WHAT'S YOUR' INGENUITY QUOTIENT?

Have you pulled off a smart one lately? We will pay for each contribution accepted for this page showing ingenious solutions of problems in the home, shop, garage, or camp. It doesn't matter if it's wacky—if it works.

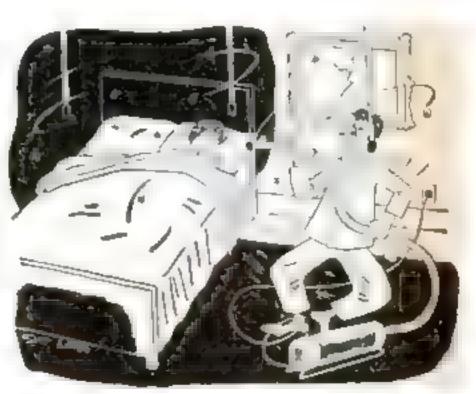

BEING NO BABY, I found crawling around on the grass to give my lawn a close shave was hard on my back. I couldn't find a pair of extension clippers, but made my short ones do by bolting them to a frame with a link action to work the blades. It's what some people might call going to grass the easy way.—C. A. Veburg.

CONTACT! Pilots used to get results with that word, but when I shouted it, the cracked spring in my distributor paid no attention. Since it was I A.M. and a long way from home, I tried substituting a piece of rubber for the jinxed spring. The points closed, and away we went.—G. R. RUEL.

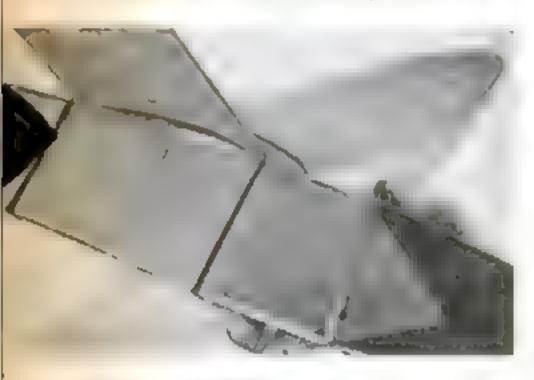

A LIGHT PURSE can mean you're broke, or that you've had a brainstorm. With me it's the latter, for I'm all aglow with the bright idea of stitching loops in my pocketbook to hold a small, flat flashlight. With the switch located near the clasp, I can open the pocketbook and flip on the light in one easy motion. Whether I'm looking for powder or pennies, this is one woman's purse that holds no secrets.—MARY JANE Coco.

At RAIDS DIDN'T END for me when the War stopped. An air force of flies and mosquitos kept me alerted for many nights. These boudoir bombardiers hardly light long enough to be swatted, so I dropped my swatter for a vacuum cleaner. The extension tube sucks 'em in like a drain does water. Now it's just a few minutes between "Attack" and "All Clear," and my walls stay clean.—Wallace N. Brown.

A folding prop cuts wind resistance and gives the model a smoother glide when the power runs down.

Both wing and stabilizer have a deep undercomber, at you will notice above and below. A slit in each rudder allows for warping to make the model turn,

# SKY CLIMBER

#### .... A High Flying Rubber-Powered Model

By PAUL MUELLER

ATHEN you fly this sleek little rubber model, you may be surprised at the altitude it reaches before the folding prop kicks in and the ship starts on a slow, flat glide. Its motor run is longer than you usually find in models of this size and an airfoil section with a deep camber produces a high lift.

The wing frame is cut from 5/32" medium sheet balsa, two sheets being cemented edge to edge. Inner edges are notched at intervals of 1" to accept the ribs, all of which are cut to an aufoil shape by use of a template. Fit the ribs by inserting one end in a notch on the leading edge and cutting to suit the corresponding notch on the trailing edge. Sand the leading edge of the wing round and the trailing one sharp. (Sand the stabilizer and rudders in the same way when you come to them.)

When the ribs are firmly cemented in place and dry, bevel the wing roots for a joint that will provide a dihedral of 3%", and reinforce the joint with triangular fairing pieces. Cover the underside of the wing first, applying cement to the full length of each rib to get the indicated camber. Then cover the top in the conventional manner, water the tissue, allow to dry, and apply two coats of clear dope. The pull exerted by the covering when finally dry will increase the dihedral at the wing tips to about 4".

Although the drawing shows the stabilizer frame only in half plan, it is cut as one piece from a 12" length of %" sheet balsa. Build and cover it in the same manner as the wing, but note there is no dihedral. After shaping the rudders, make a slit in the trailing edge of each to allow for warping to give

the model a gentle turn.

The fuselage is built in the regular manner, one side being shaped on top of the other. At the front, the first panel is filled all around with " sheet set in flush with the longerous and crosspieces. Then this is covered with 1/16" sheet extending back three panels, a deep V being cut in the back edge of each piece as shown. After

156 SCIENCE

After the power run, a spring on the shaft pulls the motor hook against a stop on the plug. This positions the prop for landing.

these pieces have been cemented in place, fair the edges with sandpaper before applying, watering, and doping the tissue.

At the rear, X" filler sheet also is installed in the side panels where the motor dowel is located and in the final V-shaped panel on top where the stabilizer goes. If desired, the panel under the dowel can be filled with a removable door. Install the dowel itself with a press fit for easier placing of the rubber. From X" sheet balsa, shape a stabilizer mount conforming to the undercamber of the stabilizer and giving a slight negative incidence when the mount is centered and cemented on the filler sheet previously fitted between the longerons.

After carving the nose block, cut a fric-

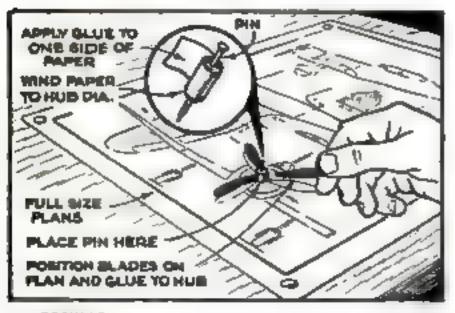

tion plate from thin tinplate and cement it to the rear face of the block. Shape the propeller with an undercamber of about %" and give it three coats of done, sanding between each coat. The hinge must have the swivel at an angle and be carefully positioned so that the blade will fold back flush against the fuselage. Cement the hinge in place, forming the prongs to the lower part of the blade, and bind the entire hinge with thread Then cut the propeller on the same plane as the hinge swivel. The counterbalance is a length of wire with a blob of solder at the end.

Since there is no landing gear, it is desirable to have the prop in a horizontal position when the model lands. This is accomplished with a spring that thrusts the shaft forward at the end of the motor run, throwing the motor hook against a wire stop on the nose plug. Although not abso-

lutely essential, an aluminum tube into which the anchor prong of the shaft can be cemented in the hub will give greater strength.

Bend a loop on the front of the shaft for attaching the winder. The entire propeller assembly pulls out for winding.

Install between 16 and 20 strands of %" flat brown rubber, lubricating it first, and the model is ready for the first test glides and adjustments. The original model used a %" right down prop thrust, making it climb to the right, and when power ceased it glided to the left, but your adjustments may be different. When you are satisfied with the first short flights, give the rubber about 300 turns with a winder—and watch her go.

#### **How to Position Prop Blades**

When you are building a small scale model of a plane, the blades of three- or four-blade props can be positioned at the correct angle by the procedure illustrated

Cut a narrow strip of paper, apply glue to it, and wind around a straight pin until it equals the hub diameter. Then place the pin in the center of the hub on your plans and glue the blades to the hub in the indicated position. - Freder Mitchell.

### Home, Sweet Home - but is it safe?

Swinging cabinet doors couse many bumps. Install doors of the sliding type.

Ground the washing machine with a wire run to a water pipe for safety.

Folding gates of some sort are practically a must in homes where a child is learning to walk but hasn't yet mostered the stairs.

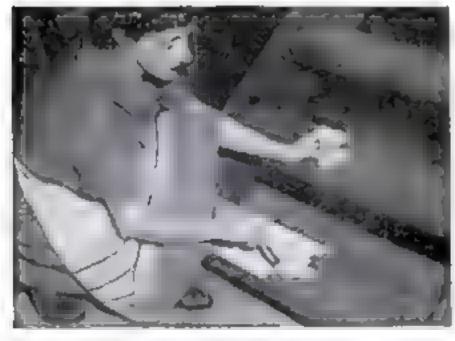

Handrails will help prevent bad falls on autside stops, particularly in icy weather.

When bumping hazards can't be removed, mark them with a bright paint.

WITH a little time and a few hand tools, you can make almost any home a lot safer. Some of the ways this may be done are suggested in the photographs and drawings on this and the following page, supplied through the courtesy of the National Safety Council, with headquarters in Chicago.

Most of these safety-engineering jobs are simple and within the capability of almost any man or woman of the house. Even if the services of a carpenter are required, the expenditure is money well spent. Check over your home and you undoubtedly will find other ways that you can help make it safe.

Many accidents occur on cellar stairs because of poor visibility. Paint white so you can see them.

If your cellar stairs are rickety, and many are, on easy job of carpentering will make them safer.

Grab bars, placed both vertically and horizontally, guard against a bone-breaking fall in the bothtub.

Wear makes electrical wires unsafe after a time. Check them over and either replace them or apply tape.

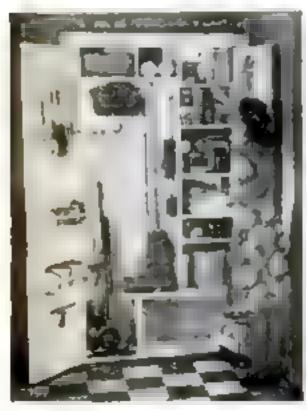

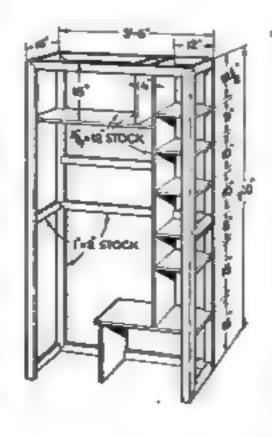

#### Shipshape Closet Has Space for All Housekeeping Equipment

Many homes still get along with an oldfashioned broom closet that holds a broom or two and has one shelf for all the cleaning supplies. A bulletin issued by the National Safety Council reports that such closets have been indirectly responsible for many accidents in the home because "father stumbled over the electric cleaner hidden behind the bedroom door; baby sister was poisoned when she drank the disinfectant stored below the kitchen sink; and mother broke her ankle when she fell over the dust mop reclining on the basement stairs."

To bring order out of this chaos, the Council has designed the housekeeping closet shown in the accompanying illustrations and suggests that it be built against a vacant wall in the kitchen or hall. The closet was

planned to allow space for all the things needed to keep a home spick-and-span. Mops, brooms, dustpan, and brushes have their own special hooks. Orderly shelves are spaced for containers of various sizes. A locked compartment above the shelves keeps poisons out of the reach of children. Metal cans hold oily dust cloths. The closet is shown with two doors, but if it is located in the corner of a room a single door, opening against the wall, may be preferable. To reduce the cost, the doors may be made of plywood.

TO SCIENCE

### Souvenir 40-mm. Shells Form Legs of Table

CRAFTSMEN who have or can obtain four 40-mm, shell easings have ready-made brass legs that will add style to a plastic-top coffee table. Drill four 3%" brass disks to receive screws for attaching to the table and solder the disks to the open ends of the shells. Then clean the brass thoroughly, rubbing with fine emery cloth, and give it a spun-metal finish by rubbing with steel wool around the circumference.

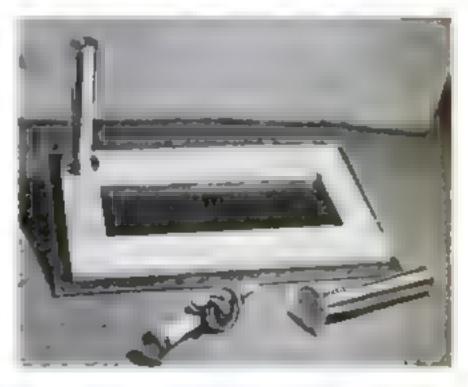

Bakelite or any opaque colored plastic will make a handsome top. Cut a %" sheet to a 20" by 30" rectangle and glue and bolt to it a doweled wood frame of %" stock. Drill bolt holes through the wood and part way into the plastic, and tap the holes in the plastic. The legs are then screwed to the wood through the disks.

For edge trim on the plastic top use strips of X" brass angle. Mater the corners carefully with a hacksaw and file until the fit is perfect. Two methods of finishing the corners are shown below—one by sawing a notch, bending, and soldering, and the other by matering four lengths and soldering corner pieces on.

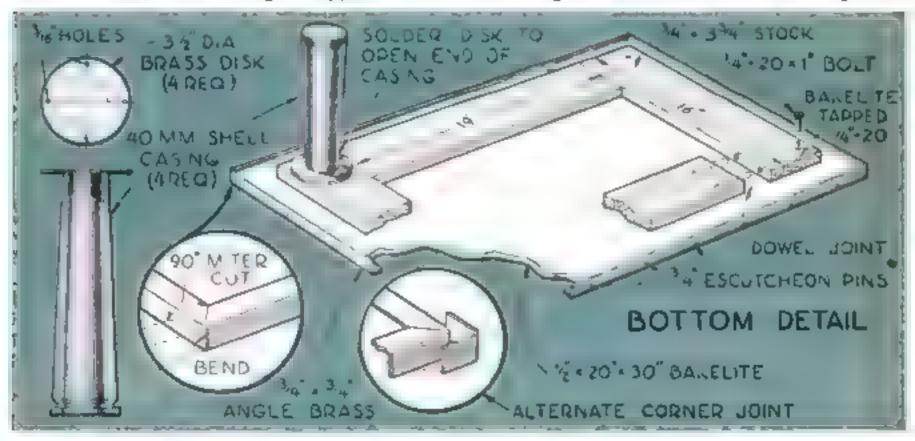

Clean and polish the brass edging to match the legs. If the surface of the plastic is scratched, remove the marks with fine pumice and a wet cloth. Lacquer the brass parts for a permanent finish, and wax the plastic periodically.—FRANK S. MYER.

Gleaming brass and a fustrous plastic top mark this coffee table. The legs are shell casings to which are soldered disks to take mounting screws.

Construction details, including the application of the brass-angle trim, are shown in the drawing below.

Sheathing is closed at the ridge and ripped to size to provide solid noting for rip rap or other trim.

## How to Sheathe a Roof

SPACING FOR UNIFORM NAILING LENGTHENS LIFE OF SHINGLES

### By Edwin M. Love

FOUNDATIONS are not only put under a house. How you lay a foundation for shingles may add years to the life of a roof. In this case the foundation is sheathing.

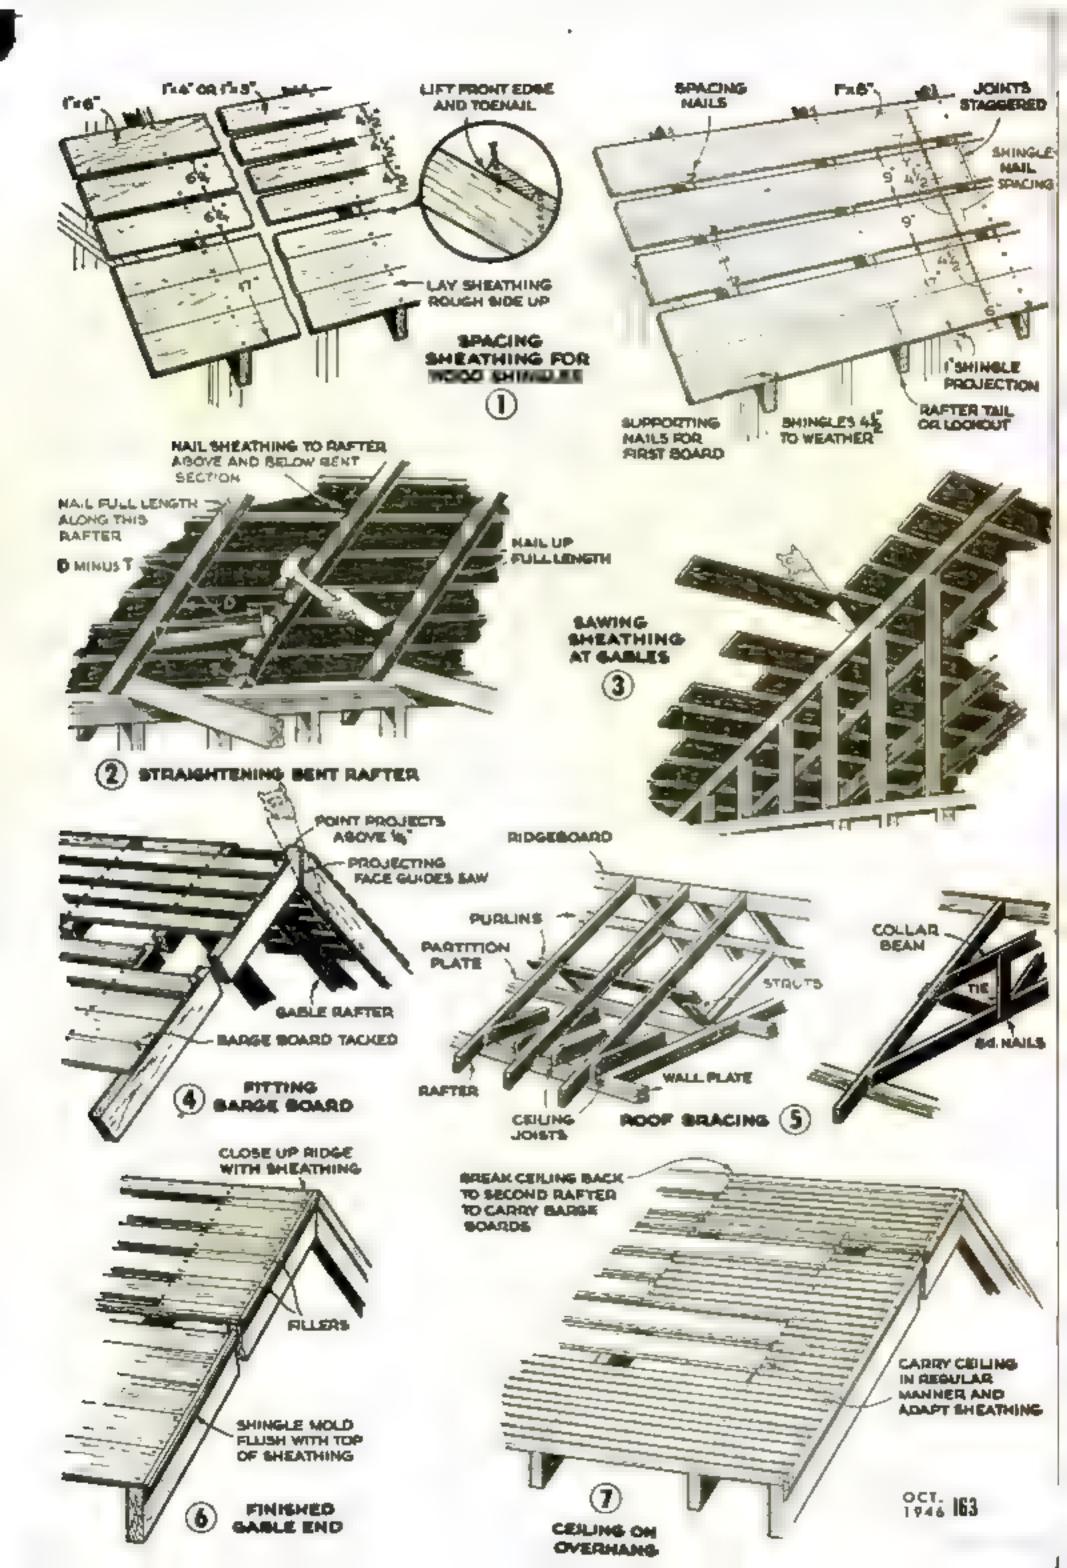

Starting boards should be of clear lumber, or at least free from loose knots, and some painting labor can be avoided if they are given one or two coats on the face while on sawhorses. For the first course select pieces of equal width and dress one side of each. Start support nails in a few rafters to keep the boards from sliding off, and tack the first boards to allow for shifting when they are straightened. Make joints on rafters and let, them project as they will at the gables.

Length can be found by butting the far end of a board against its rafter and marking for the cut by the corresponding side of the near rafter. Then move the board back half the thickness to make the joint. Sight along the eaves, straighten the starting boards, and nail them fast. Lay enough tightly together to cover the overhang.

Roofs to be covered with paper or composition shingles are sheathed solid. The process is a continuation of that over the eaves. Time is saved by tacking the boards in place until a side is covered. Then start nailing at one rafter and continue along its length, attempting to emulate the carpenter who drives his nail in three blows and seldom misses a count until his handful is used up. Sheathing is laid rough side up.

Most composition roofs are sheathed with 1" by 6" lumber, but other widths are acceptable. Stagger the joints and extend enough at the gables to carry the barge boards without noticeable sag. The spaces left are later filled in with scraps. Cover knotholes or loose knots with tin patches beld with shingle nails.

Sheathing for wood shingles is customarily spaced, not only to save material, but also to ventilate and dry the shingles, a,

Space and tack sheathing in place for an entire side, and then not it permanently. Not along the length of one rafter at a time. The sheathing is laid with the rough side up.

matter of considerable importance in damp climates. Many builders use 1" by 4" sheathing spaced about 2%" apart. Much better is spacing that corresponds to the amount of shingle laid to the weather, as shown in Fig. 1. Thus, if the sheathing is laid 4%" on centers and the first spaced board is placed 17" above the eaves (or 17" plus 4%" or a multiple), shingle nails can be placed uniformly 6" above the butts, with a coverage of 1%" by the next course of shingles.

You will find 3" sheathing just as satisfactory, and it will give more toe room as well as better space for inserting handfuls of shingles after the bundles are opened. If only 6" sheathing is available, lay it 6%" on centers, and the spacing for shingle nails will not be too far from ideal. For 8" sheathing, laid 9" on centers, drive two rows of shingle nails in each course. Close the sheathing at the ridge to provide sound nailing for rip-rap or other trim

While the sheathing is being nailed, straighten local side bends in the rafters. Nail neighboring rafters solid, and nail up the straight part of the crooked rafter; then go under the roof and drive in a spreader block to force out the bend, as illustrated in Fig. 2. Finally nail the sheathing to the corrected rafter and knock out the block.

If the joint between two barge boards does not fit perfectly, it can be corrected by running a fine saw between the ends, after which tacking is withdrawn and the second barge board moved up.

When the sheathing is nailed, measure for gable projection at the ridge and eaves. Then strike chalk lines or draw pencil lines along a straightedge and saw off projecting boards, as in Fig. 3.

Barge boards, the rafterlike members that frame the gables (Fig. 4), are of 2" clear stock, usually 6" or 8" wide. Select pieces to cut in pairs (the upper ends only) with crowned edges up and the best faces out. Hanging them is a two-man job. Locate the upper end of the first by butting it against a strip nailed at the center of the ridge, and then tack it, springing it in or out to conform to the sheathing before final nailing.

To place the second barge board, start a few nails in the sheathing and tack it, holding the board in place with the upper end against the first board a little above and behind it. Inspect the joint and, if it does not fit, run a fine saw through it, as shown in Fig. 4. Withdraw the nails, drive new ones, and tack again. If the fit is satisfactory, tack again and toenail through the upper edge into the first barge board to drive it down; then nail solidly and finish nailing the board. Plumb a line at one end of each barge board and cut it to length.

The roof is now ready for bracing (Fig. 5). If narrow, it may require only a sway

When both the barge boards have been permanently nailed in place, plumb a line at the ends and saw them off vertically to length. They are held to the roof simply by nails through the sheathing.

brace, or it may be possible to support it by means of posts from partitions carrying purlins nailed across the rafters midway between ridge and plates. In any event, check with the local building office.

Where partitions are lacking, use 1" by 6" collar beams nailed across alternate rafters halfway up, and bring struts down from the centers of the beams to the centers of the ceiling joists. In most cases the sheathing will have drawn the rafters into alignment, but some sag may be present near the center of the roof, and this should be checked before braces are nailed permanently. If necessary, prop up the sags from the floor until collar beams are placed.

Before shingling, nail in fillers and nail shingle molding to the barge boards with the upper edge flush with the top of the sheathing, as in Fig. 6. This hides the ends of sheathing boards and is a neat finish.

Figure 1 shows ceiling board on the overhang. The ceiling breaks back to the second rafter only at intervals so the pull of the barge board will not spring that rafter and cause a hump that might split the shingles. For more rustic effects, finish-nail sheathing on from beginning to end as on the main roof. This allows the shingles to show between the sheathing at the overhang.

Short lengths of filler strips may be nailed in between the sheathing from the barge boards to the first rafters if a rustic effect with shingles showing through is not desired.

Collar beams noiled halfway up between alternate rafters supply bracing at points where partitions do not come. Use 1" by 6" boards.

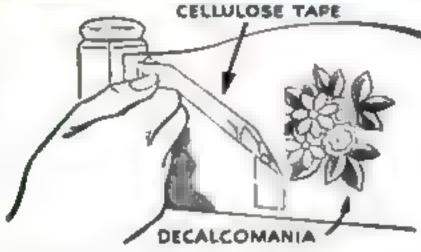

#### KEEPING the HOME SHIPSHAPE

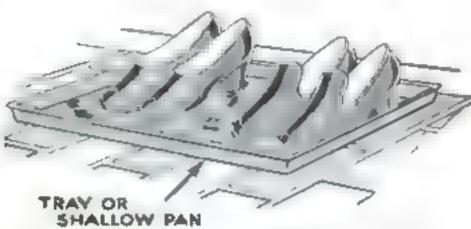

Shelves built under the cellar stairway provide storage space for canned foods. Cleats nailed to the inner faces of the stringers at the level of the treads will support the shelves. Another idea is to remove the drawers from an old bureau and replace them with shelves, as illustrated above.

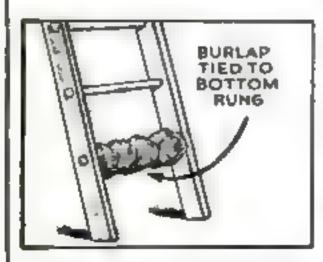

Scotch tope can be used to peel water-set decals from furniture without marring the surface. Stick a strip of the tope on the decal, smooth it, and then lift. The decal will came up with the tape.

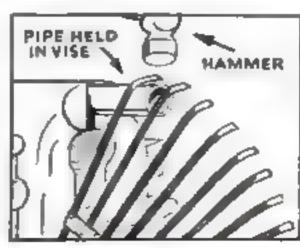

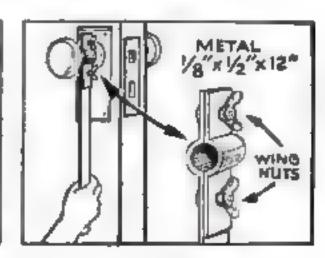

Your floors will remain much cleaner if you place a cookie sheet or tray on the floor near the door and ask all the family to put their wet or muddy rubbers there the moment that they came in.

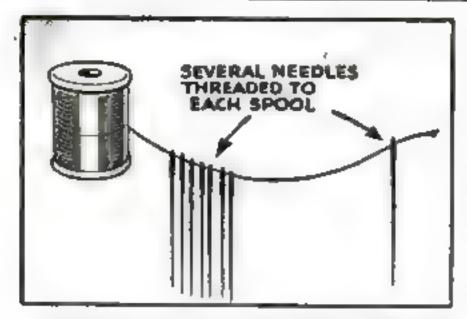

Burlap wrapped and tied around the first rung of a ladder will help keep the upper rungs clean of mud in wet weather and thus make your footing more secure. When leaf rakes with metal times lose their bits, new hooks can be shaped as below. Clamp a piece of pipe in a vise and hammer a new hook in the end of each time.

When a small child can't gultare reach a doorknob, this gadget will save adults of the house many steps. Metal is best, but it might also be made of wood.

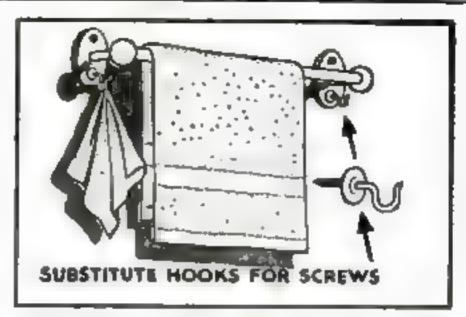

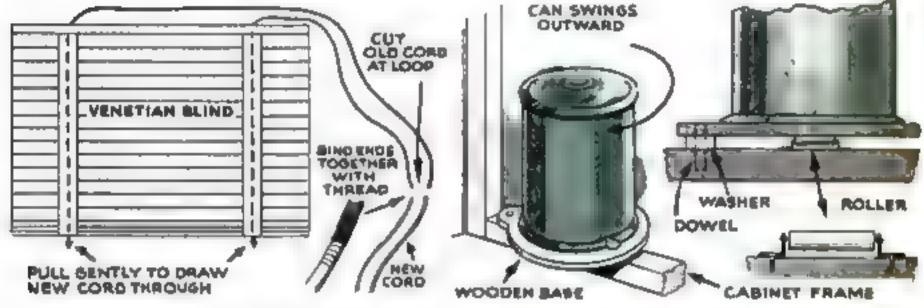

Needles threaded as above will be helpful for a person having poor eyesight. One needle then can be used with each piece of thread cut off.

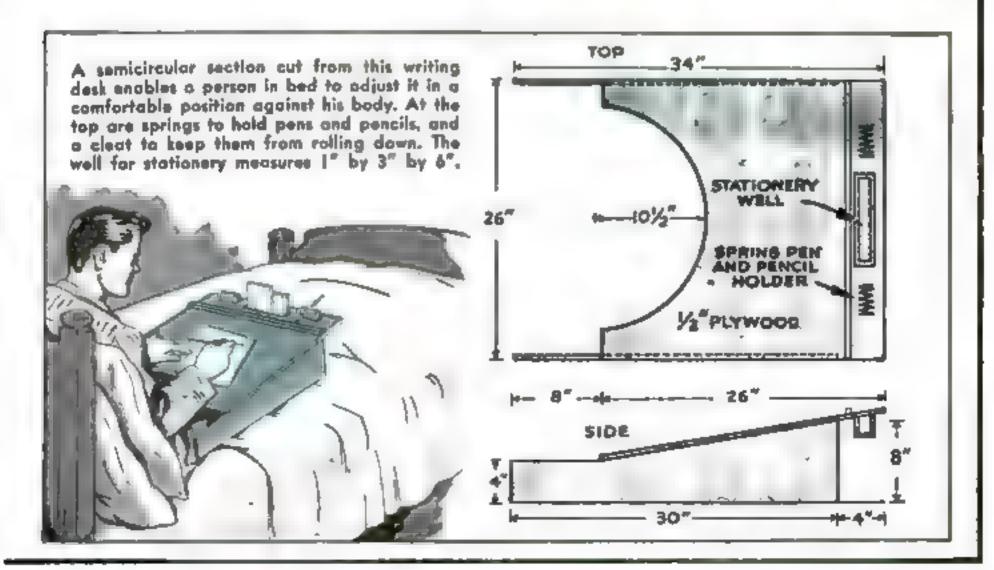

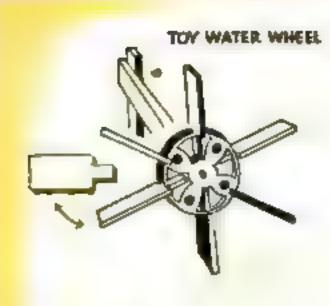

To increase the capacity of a towel rack, remove the lower screws and substitute hooks. Additional towels or face cloths can be placed on the hooks.

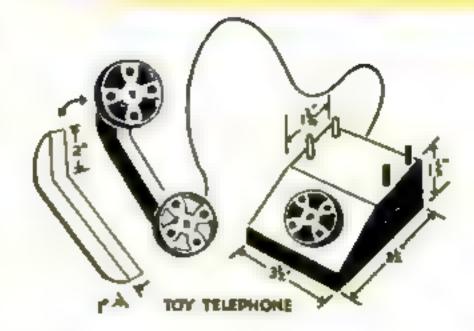

By the method shown above you can install new cords in Venetian blinds without taking them down. Gut the old cord, splice on the new one, and slowly pull the old one out and new one in.

A step-on garbage can installed under the sink as above may be quickly swung out with the fact when needed. The outer can is screwed permanently to a pivoted wooden base that rides on a small roller.

SPOOLS FOR

#### Ten Uses for Typewriter-Ribbon Spools

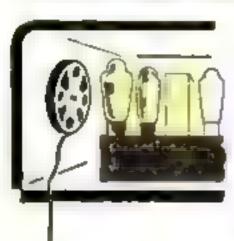

EMPTY typewriter-ribbon spools are discarded by the hundreds in many offices and schools, and in homes where a typewriter is used one becomes available occasionally. Here are some quick ways of transforming them into useful parts again. When a spool is used as a revolving member, it is a good idea to equip the bolt, screw, or other axle with washers on each side of the spool to cut friction.—Ralph S. Wheres.

TOY WINDMILL

WHEELS FOR TOYS

EEL FOR PORTABLE AERIAL

REVOLVING THE RACK

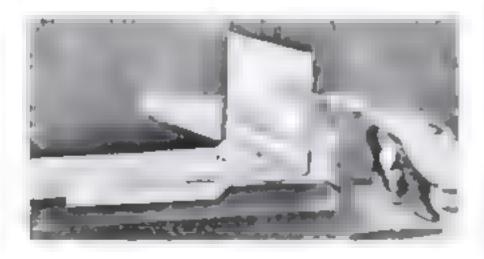

WHITTLED BLADE

SOLDERING -IRON STAND

A BELL-SHAPED GUARD on a rotary drill press planer distributed by A. D. McBurney, of Los Angeles, is designed to protect the hands and keep chips from flying upward. A single cutting blade and one-spot adjustment are other features. Known as Safe-T-Plane, the planer fits any drill press, and will plane, rout, panel, bead, or rabbet to various depths in wood. Cutters for metals are available.

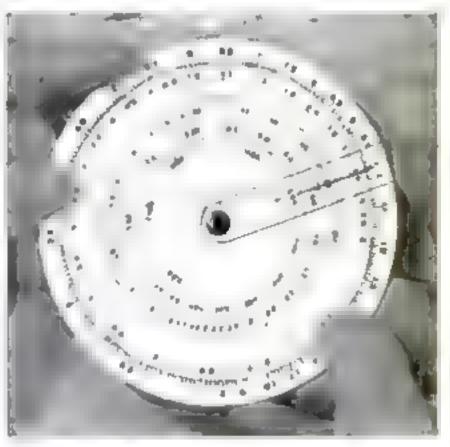

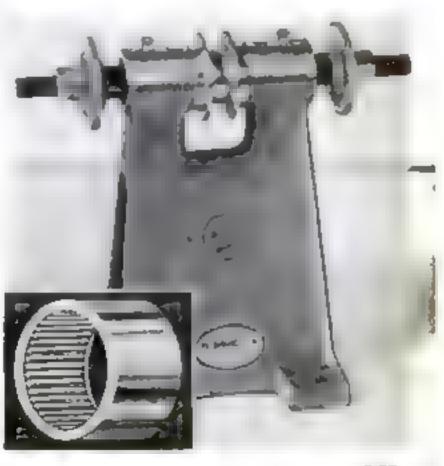

SAWING TO AN ANGLE is easier with an all-metal saw guide that fits boards of any size and will accommodate any handsaw. A turn of a wing nut quickly secures the miter head at the desired angle. The Bonaire Company, of Minneapolis, Minn., makes it.

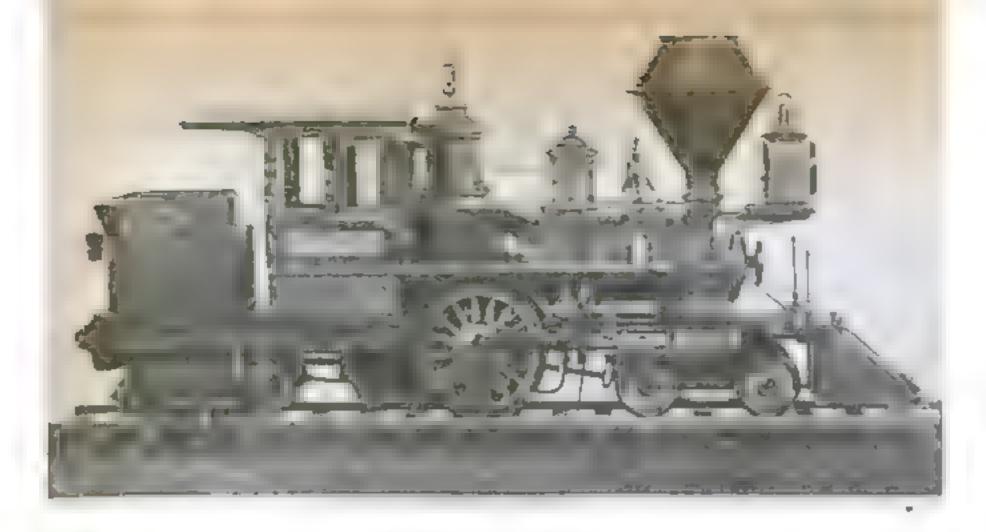

NEEDLE BEARINGS, providing smooth, low-friction running without play, are a feature of a new grinding and polishing head produced by the Darra-James Corp., of Water-bury, Conn., for industrial and home-workshop use. The head itself is a solid bronze casting, the shaft is of hardened steel, and the pulley is machined from solid aluminum

POCKET-SIZE CONVENIENCE is combined with hairline accuracy in the simplified Calculaide Commerce slide rule developed by American Hydromath Company, of New York. Made of plastic 4%" in diameter, the circular slide rule has the most-used scales close to the edge so that each is actually 12%" long. Conventional C and D scales, plus a spiral log-log scale ranging from 1.01 to 100, are provided.

Glued to a short length of track on a wooden base, the model of the C. P. Huntington is ready for display.

# Southern Pacific Engine No. 1

Boiler and Fittings Complete Your Model of This Famous Old Diamond-Stack Locomotive

By ALFRED D. SLATER

#### Port II

IF YOU have completed the drive mechanism, frame, wheels, trucks, and other parts of your model of the C. P. Huntington as described in a previous article (see PSM, Sept. '46, p. 170), you are ready to proceed with the boiler, cab, and miscellaneous fittings that will bring your work to finished shape.

On the prototype, the link motion, which is illustrated in Fig. 12 on page 173, was used to control direction and speed, the engine being in full forward gear, or full backward gear, according to whether the slotted link was pulled entirely over one way or the other. When the link was in middle position neither eccentric operated and the engine came to halt. At intermediate positions, the valve stem was influenced by both eccentrics; and the point of cutoff, and therefore the speed of the engine, could be varied at will.

Since this wooden model of the famous locomotive is purely decorative, the ec-

centrics are left loose on the driver axle. Make the component parts as shown in Fig. 12, noting that only three levers are required because a control rod to the cab is placed on just one side of the engine. Assemble the various pieces with glue.

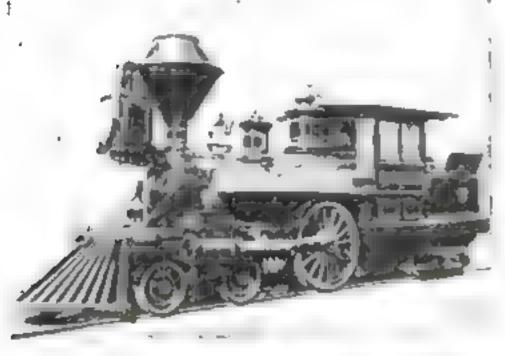

The boiler (Fig. 13) consists of two cylinders, 1%" and 115/16" in diameter, an irregular come expansion section, and a firebox, arranged in that order from front to back. The top portion of the firebox is semielliptical in cross section, having a major-axis half length of 1 9/32" and a minor-axis half length of 1 3/32". Under the bottom of the firebox cement an ashpan 5/16" by 1 5 8" by 2 3/32" in size, with edges beveled. Against the rear of the firebox and boiler, cement a boiler head of the size shown, rounding the top edge.

Supporting the boiler at the front end is a %" by 1 11/16" wooden pin thrust into the cylinder and the front-truck saddle. At the rear a %" by %" by 2 3/16" cross member screwed to one of the main-frame cross-pieces provides support. Rivets are simulated with escutcheon pins on %" centers. Boiler strapping may be made of thin card-board, strips being cut 3/16" wide.

A bracket, detailed in Fig. 17, supports the running board. At a point about 1%" ahead of the cab the running-board width should be decreased by %" on the outer edge, a diagonal cut being made toward the front of the engine above the driver hub.

The 3/32" tube leading from the bottom of the pump (Fig. 13) should be carried back far enough so that the end is hidden by the rear truck. Glue the mudguard to the underside of the running board, positioning it directly over the driver. Support each of the two 1/16" grabrails by two 1/16" ballhead stanchious glued into holes drilled in the boiler, and glue the rear end of the rails to the forward face of the cab.

Under the cab and the tank (Fig. 14) runs a 1/8" by 15, 32" baseboard, the top of which is even with the top of the rear buffer. Atop this baseboard is set a 5/32" floor plate that has a 3-32" half-round molding around its edge except in the place where the firebox goes. The cab and tank flooring pieces are

The West still was new when the C. P. Huntington, above, began chugging over the California rails. It now is permanently displayed in Socramento.

On the model, it is best to use wire for some of the fittings. The tank is carved from solid wood.

3/32" thick and are beveled as shown in Figs. 14 and 15. Along either side of the cabruns a 13/16" by 1 3/16" by 2 25/32" seat which exactly fills the space between the cab flooring and the running board. The outboard side of each seat is decorated with two rectangles of glued-on cardboard moldings.

Make the cab walls and roof from 1/16" plywood. After cutting window openings in the walls as indicated, frame them where shown with 1/16" cut-out backing pieces. Isinglass glued inside will give realism to the windows, and, if desired, an arm rest may be glued at the base of the open rear window. Cut the tank body from a single piece of wood, and glue on the flanges, brackets, and manhole. The grillwork around the flange top, the grab rods, and the manhole-cover handle may best be made of wire. Two pails and two steps complete the cab and tank.

It is unnecessary to make the bell bracket a jointed affair that actually permits the bell to ring. A solid frame fashioned from a single 3/16" piece of wood will suffice. The bell itself can be turned on a lathe, or it may be that you can find a toy one that will

serve the purpose.

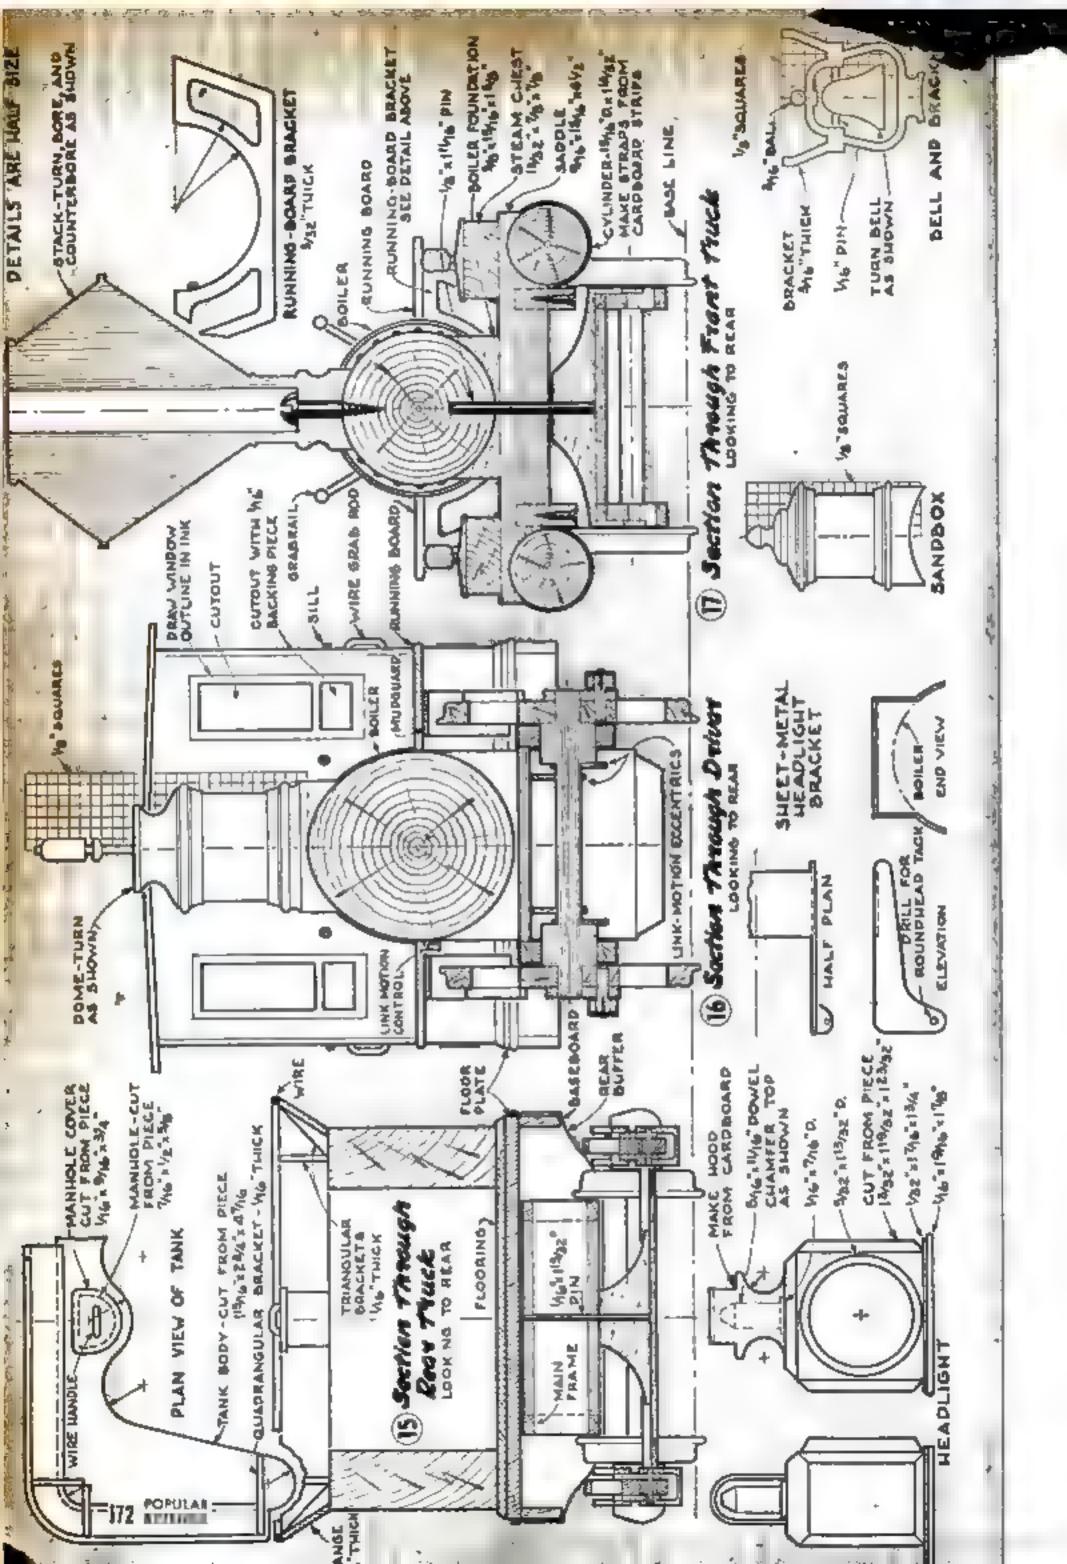

After the dome (Fig. 16), sandbox, and stack are turned, they may be fitted to the boiler contours either by carving and filing or by shaping on sanding drums of diameters equal to those of the boiler at the various places where the fittings are located. The headight bracket of this particular model was laboriously carved from wood, but it may just as well be cut from a piece of tincan stock, bent to shape, and fastened with two roundhead tacks.

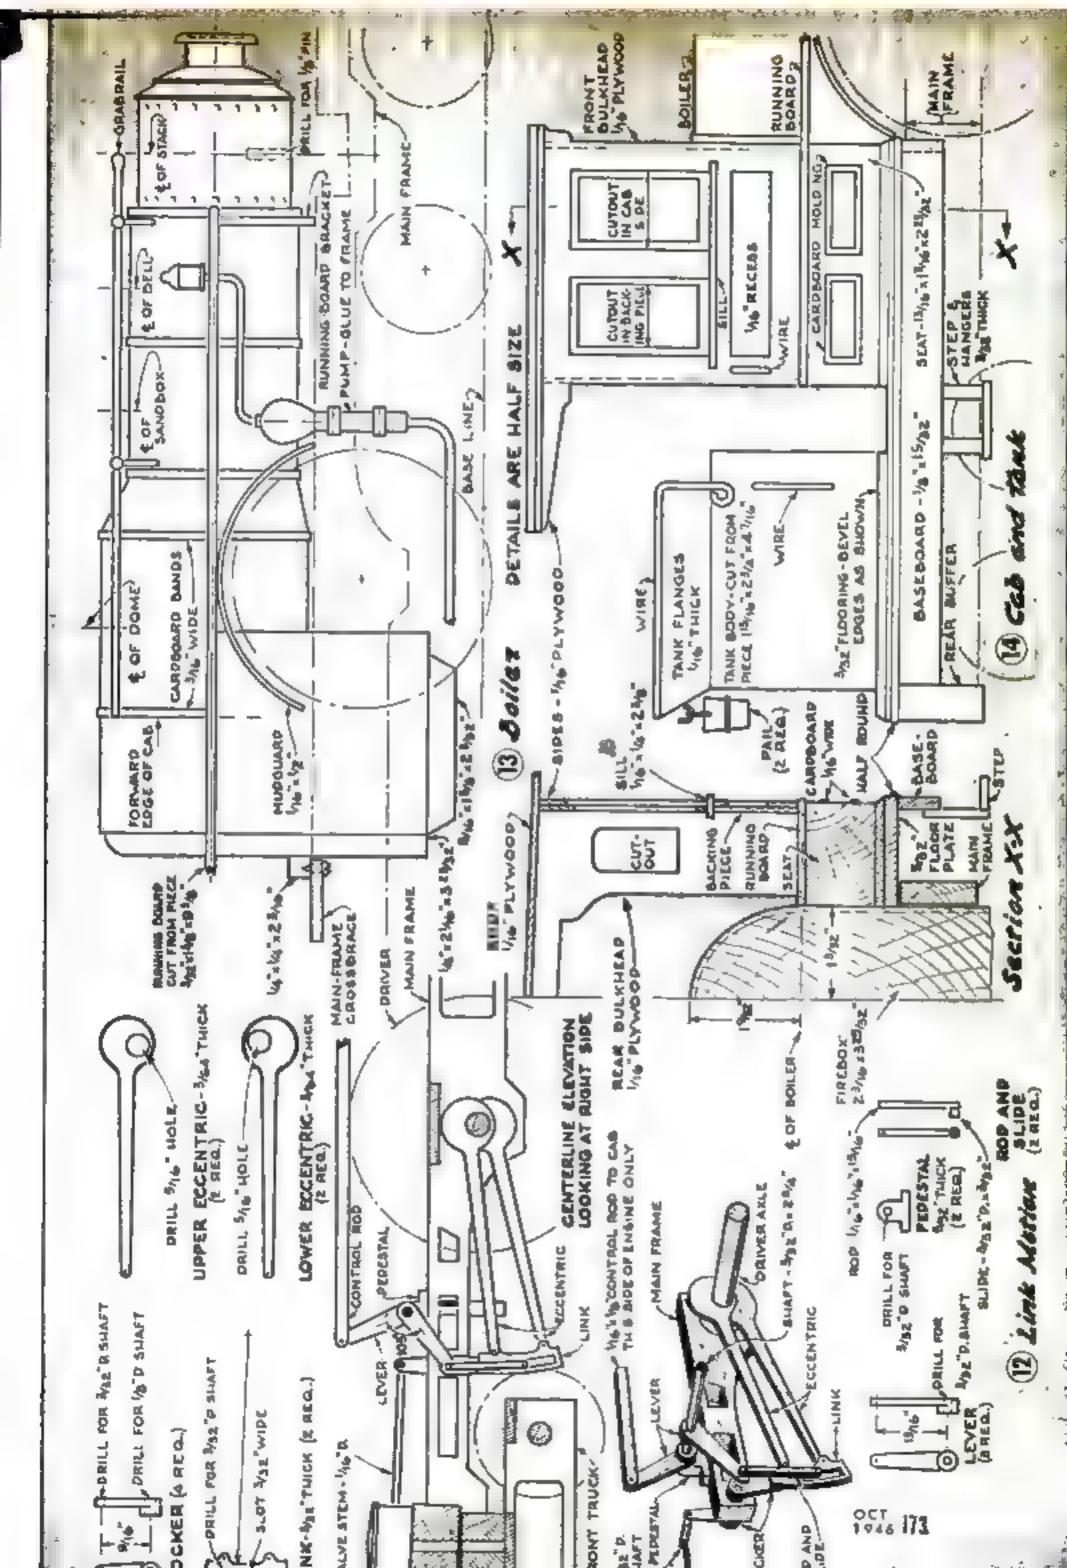

There are several possible ways to finish the model. The color scheme of the original Huntington consisted of an elaborate combination of cherry, green, various reds, nickel, black, and gold. The pictured model is finished in black-walnut and colonial-maple stains and several coats of thin shellac. A realistic and attractive appearance also may be obtained by applying two coats of metallic flat black to the smokebox, stack, and firebox; then two coats of gloss black elsewhere, rubbing down with No. 000 sand-paper between coats.

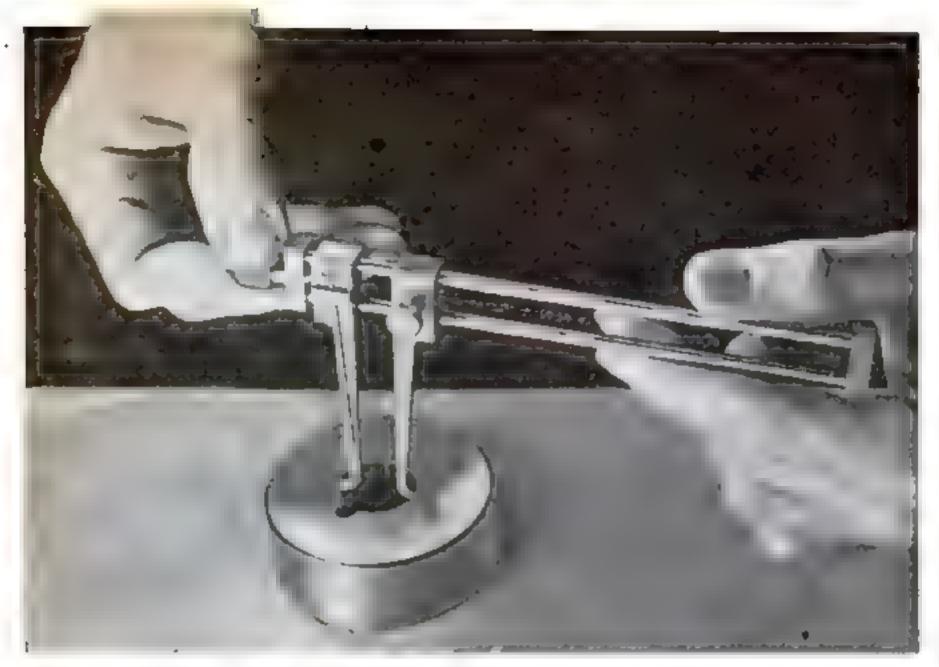

Mount the model on a short length of wooden track glued to a beveled wooden base, and it's ready for your mantelpiece.

Detailed plans for completing this model of the engine are given on the next two pages.

When the diameter of a hale is being measured, the thimble is adjusted until the pointer indicates zero.

## Indicating Inside Calipers

By FRANK McCARTY

NOT all of us are in the position of the oldtime master machinist who could "feel" when caliper and micrometer measurements were exactly right. For the less experienced whose "feel" with inside and vernier calipers and inside micrometers is too often uncertain, the indicator calipers shown here will reduce the chances of error.

One leg is clamped at the approximate setting called for by the measurement being taken, and the other is then adjusted by a screw until a pointer indicates zero. The contact points are next measured with an outside micrometer to the same pointer reading. A correct measurement is thus obtained by sight instead of touch. The instrument has a range of %" to 6".

Shaft holes are accurately spaced in the frame blocks by the simple jig shown on the facing page. Holes larger than he are redrilled outside the jig. All four blocks should be marked so they can be assembled on the shafts in the same position as drilled.

The ratio of the lever action of the pointer is 1 to 11. A .001" movement at the foot will register .011" on the scale and, as the calibration marks are spaced 1/32" apart, each

space will represent an actual movement of .003". Plus and minus marks determine when the true diameter is being measured and also indicate taper and out of round.

Make the blocks of mild steel. Drill all three holes in the front frame block in the jig, redrill the middle hole to 3/16", drill No. 47 setscrew holes into each end of the shaft holes from the back, and tap them 3-48. The rear frame block is drilled the same way except that the middle hole is omitted.

All three holes are drilled in the indicatorleg block with the jig. The center hole is then redrilled with a No. 21 drill and threaded with a 10-32 tap. Both outside holes should be reamed to 3/16" for a snug fit on the shafts. If a reamer of this size is not available, redrill with a No. 14 drill (.182"), finish with a correctly sharpened 3/16" drill, and lap with a piece of fine emery cloth on the end of a %" rod.

No middle hole is required in the adjustable-leg block, and the two outside holes are treated the same as those in the indicator block. The clamp-screw hole is drilled through with a No. 21 drill and threaded with a 10-32 tap. A 1/32" slot is then cut down from the top of the block through the center of one hole and into the other, after

The cal pers are removed from the work and a micrometer adjusted on them until zero is again and cated,

which the threaded hole is reduited with a 3/16" body drill from the front face to the slot

For the shafts, two pieces of 3 16" drill rod are turned down to X" diameter for a on each end, and polished. To make the clamp screw, knurl one end of a bit of 7, 16' drill rod, turn the head and shank, and thread the latter. Then cut the screw off, reverse it in a smaller collet, and face the top of the head.

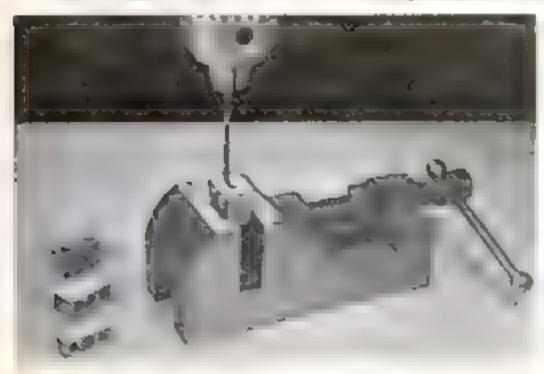

The threaded spindle is 5 16" drill rod, turned for 15" to 3.16" diameter and faced off at the end with a slight radius. Reverse it in a 3 16" collet, turn the other end for 5" to 3/16" diameter, leaving a

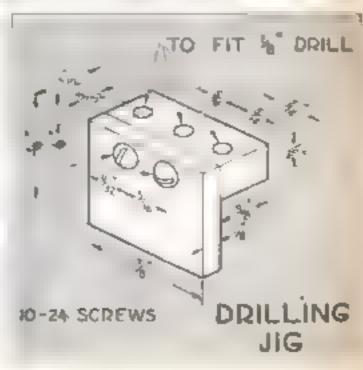

1/32" shoulder, and thread 10-32 to fit the indicator block

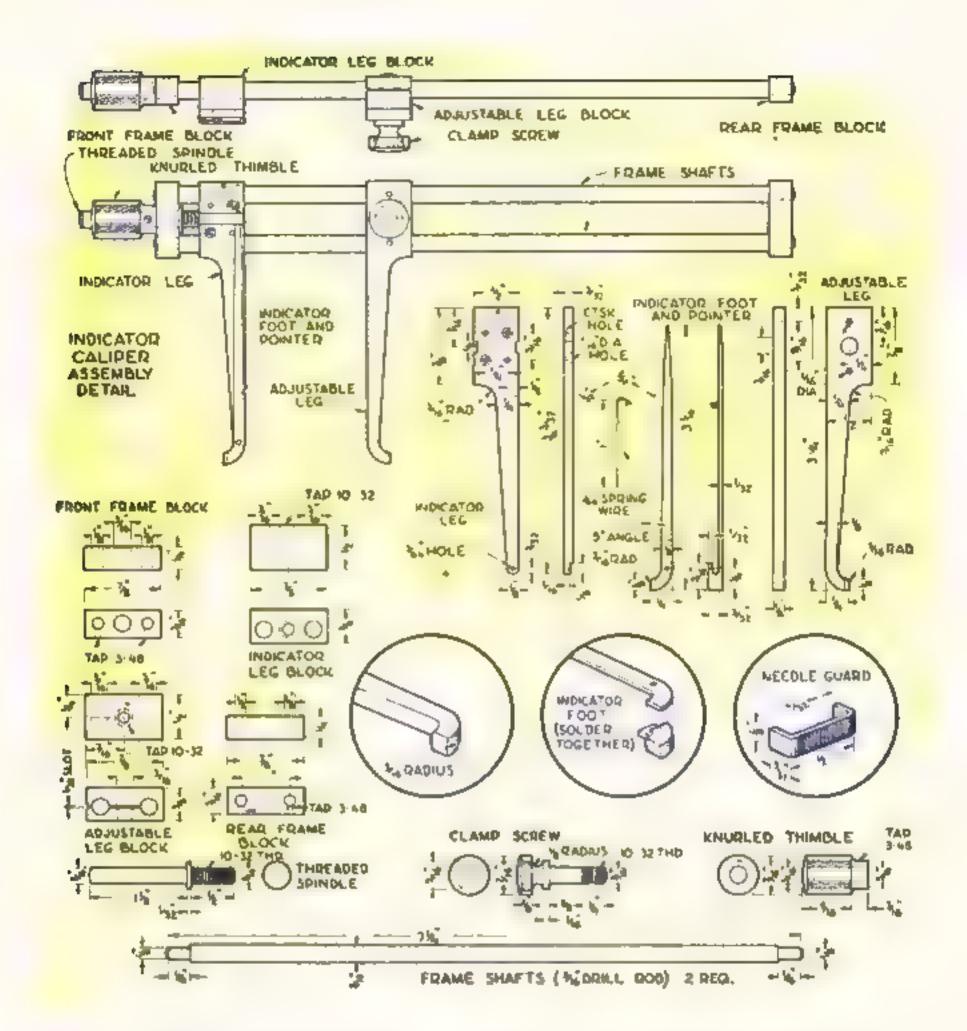

It can chucking the thimble, made of 7 16" drill rod, can be knurled, turned, and drilled 3 16". After cutting off, reverse the part and face the other end with a slight table. A No. 47 setscrew hole is drilled and tapped 3-48 in the smaller drameter for as sembly on the spindle shank.

Hacksaw the admistable leg from %" mild steel, finish-file to shape, and polish with emery cloth and oil. Clamp it on the frame block, drill holes a tight fit for 1/16" pins, and press in the pins after cutting these 3 16" long and filing them slightly on one end. The clamp-screw hole is picked up

Accurate alignment on the shofts will be assured if the frame blacks are drilled in a homemade jig to that shown below. Males that are to be larger than 1" diameter are redried to size outside the jig

from the back with a No. 21 drill and redrilled from the front with a 3 16" drill File the outside of the foot to a 3, 16" radius to permit only one contact when measuring.

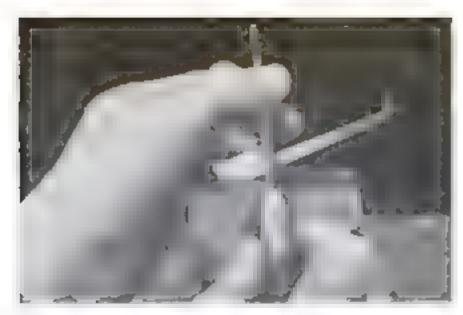

The indicator leg is sawed and filed to the same profile from 3,32" stock, but without a foot. File the lower end to act as the butt of a hinge for the pointer. Locate the calibration marks on an arc scribed from the hinge-pin position. These marks should be laid out first with India ink 1/32" apart, and then stamped into the surface with a small chisel made by grinding a sharp edge on a hardened pin or punch. Stamp a small zero over the middle line with a new nail-set punch.

Drill four 1/16" holes for fastening the

leg to the frame block. Countersink two holes on a diagonal for small machine screws—the other two are for pins. The 0-80 size is ideal, but if a tap smaller than 2-56 is not available, this size will do.

Clamp the leg on its block, respot the holes, and drill the pin holes with a 1/16" drill. Then drill the screw holes and thread 0-80 or 2-56. Shape a guard for the pointer from 1/32" sheet metal and solder in notches filed in the side of the leg.

The indicator pointer is made in two pieces with a recess filed in the foot to fit over the bottom of the leg. Solder together tightly and finish-file to appear as one piece. The radius on the foot will have to be on an

Both the indicator leg and adjustable leg can be hacksawed to shape and finish-filed and polished.

Calibration marks for the Indicator scale are put on with India ink and then stamped with a chisal,

angle so there will still be only one contact.

Fit the pointer over the leg and drill both together at the hinge with a 3/64" drill. A small piece of steel knitting needle can be used as the hinge pin. Shape 1/64" spring wire as shown, and solder it to the back of the foot just above the pin to provide tension when it is hooked about the back of the leg.

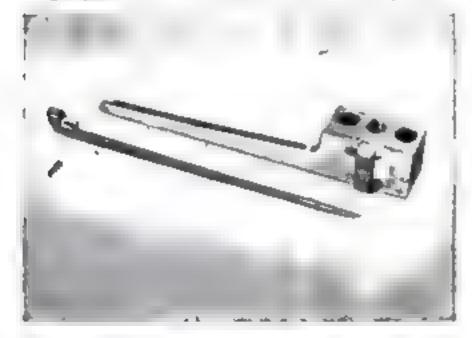

Assemble the legs and blocks on the shafts and tighten the setscrews. If 3-48 setscrews

cannot be obtained, cut short lengths from the ends of roundhead machine screws after slotting the ends with a fine saw. No. 6 screws will do if the pitch is as fine as 40.

Screw the spindle into the indicator block and push the shank through the end block. Slip the thimble over the spindle shank against the end block; then tighten the setserew. Apply a coat of any good rust preventive to preserve the finish.

Here is the Indicator leg with its pointer and hinge pin. The contact foot is on the pointer.

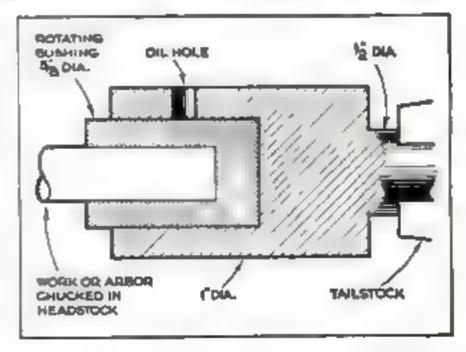

Tailstock Live Center Is Equipped with Revolving Bushings

When centerdrilling is undesirable, work can still be centered accurately on the lathe tailstock with a live center like the one shown at right. Turn the body from 1" brass rod, drill a %" hole in the end 1" deep, and drill a small oil hole in the top. The "live" part of the tailstock center is a bushing 1%" long cut from %" brass rod. It revolves in the body when well oiled and centers the work automatically.

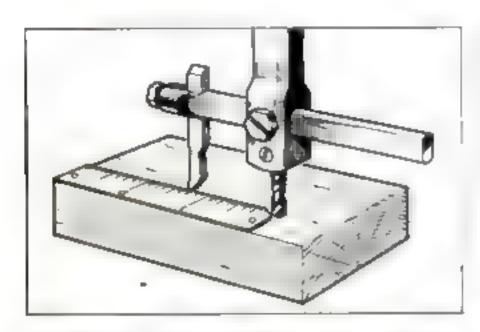

Cut a number of bushing blanks and drill them to receive work of various sizes as needed. If you save them, you will soon have a complete set.—H. P.

# NEW SHOP IDEAS

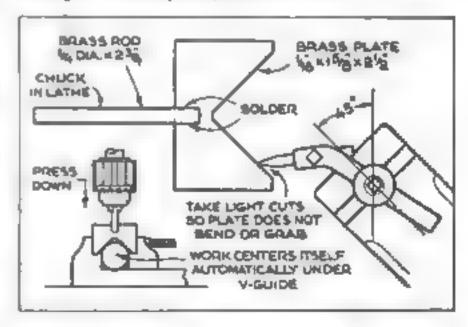

AUTOMOBILE RIM CLAMPS provide an efficient way to fasten work to the faceplate of a lathe, since the right-angle ends often eliminate the need for blocking. Clamps are available at little cost from most automobile junk yards.—Sidney Pott.

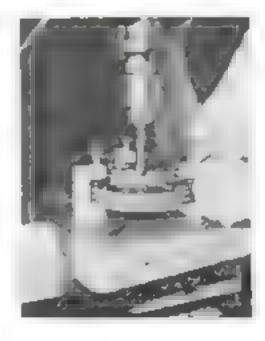

section of an inexpensive metal scale on a wooden block. Drill a hole the size of the pilot drill through the block. Next cut off enough of the corner of the scale so that it can be mounted on the block with two adjacent edges exactly in line with the center of the hole. To set the fly cutter, simply lower the chuck until the pilot drill is in the hole in the block and the cutter touches the scale. Then move the cutter along the scale to the desired radius and lock it there.—RICHARD SALZER.

DRILLING ON A DIAMETER is easy with this guide for locating round work on a drill-press table. When pressed down on the work, the guide, held in the chuck, forces round pieces into the exact center position for drilling. It is made of two parts, a %" or 5/16" brass rod about 2%" long, and a 1/16" brass plate about 2%" by 1%". Slot the rod and solder it over one side of the plate. Then hacksaw a rough V in the plate and insert the assembly in the chuck of a lathe. With the compound rest set at 45 deg., finish the V, taking light cuts with a sharp, carefully adjusted tool.—H. P.

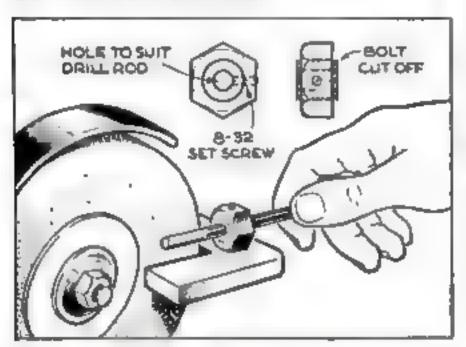

MATCHED CLAMPS, holding several pieces for simultaneous drilling, greatly simplify accurate spotting of holes through all pieces. A set of four clamps, made from steel, brass, or aluminum bar stock, supports work perfectly level on the drill-press table, since the lower legs of all four match exactly in thickness. Short standard screws are used, resulting in a low setup that will not interfere with operation of the drill chuck or feed handle. The drill-press table must, of course, be level.—J. C. MAGEE.

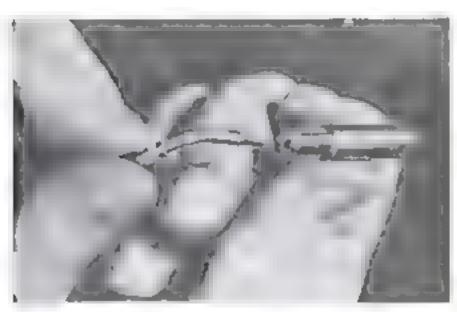

178 SCIENCE

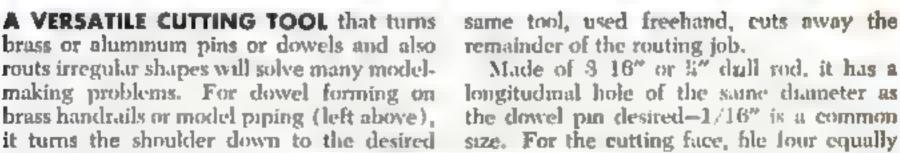

ACCURATE HEXAGONAL SURFACES can be ground on rods by using an ordinary bexagonal nut as a guide. Through one side of a nut just slightly larger than the rod, tap a hole for a set screw. Slip the nut over the rod and tighten in place; if the rod and nut are not concentric, a bushing should be used to center the rod. With the nut on the work table of the grinder, one surface after another is ground. With care, the results are as truly hexagonal as the surfaces of the nut.-Geo. Schrader.

A LATHE DOG of the clamp type will often get a threading die into cramped spaces where an ordinary diestock cannot be used. For accurate alignment, clamp the die firmly in the dog while both are held down on a flat surface. The driving tail of the dog serves as a crank.—C. W. Woodson.

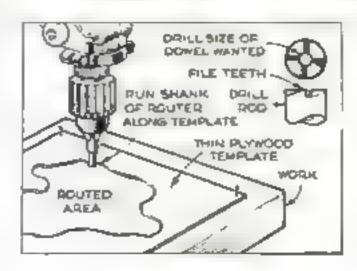

dimensions after the piece has been bent, chromating the difficulty of bending a tiny rod and dowel to exact dimensions. Another use is to chuck the tool in the drill press and rout the edges of irregular shapes, running the shank along the rim of a template or pattern (right above). The

same tool, used freehand, cuts away the remainder of the routing job.

Made of 3 16" or 2" dull rod, it has a longitudinal hole of the same diameter as the dowel pin desired-1/16" is a common

> spaced teeth in one end. Harden it by heating to a cherry-red color and quenching in salt water. Then temper by heating the shank until a light straw color travels down the shank almost as far as the teeth, and quench in water again immediately. -Herbert Peister.

### Inspection Scope Has Its Own Light

Want to Examine Gun Barrels, Machined Bores, or Pipes? With This Gadget You're Inside Looking Out

IF YOU'VE been hankering to know what the inside wall of your shotgun barrel looks like, this deep-hole inspection scope will satisfy your curiosity. A telescopic instrument carrying its own light, the scope permits interior examination of any tube or hole big enough to admit a flashlight bulb.

Only inexpensive materials are required to make the instrument. The parts needed are a positive lens, a negative lens, two telescoping cardboard or metal tubes, a rather stiff metal strip about 1/16" by 3" by 24", the lamp socket from a flashlight, a two-cell flashlight bulb, two flashlight cells, a wall receptable, a length of lamp cord with plug, a small piece of mirror, and 30" of insulated magnet wire.

The metal strip forms the base of the unit.

At one end is fastened the telescope, which does not extend in use within the hole. The mirror is set at an angle near the other end of the base, and the flashlight lamp is behind the mirror.

The telescope, an opera-glass type, uses two simple lenses of the sort available from dealers in surplus and chipped-edge optical materials. For the objective, a positive lens of about 148-mm, focal length and 24-mm, diameter is needed, while the negative eye-piece should be of about -74-mm, focal length and 17-mm, diameter. Lenses of similar dimensions may be used, but the diameters should not be too large for convenient mounting, nor too small to provide a good field of view.

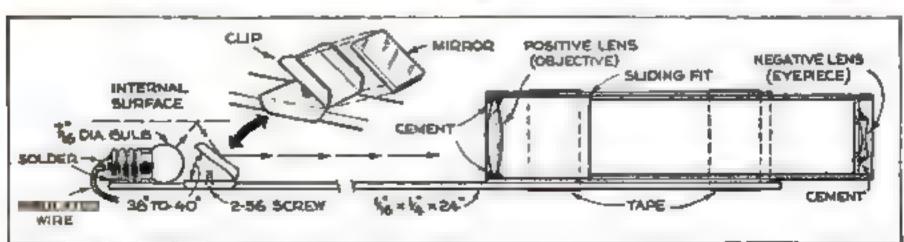

Any two slide-fitting tubes slightly larger

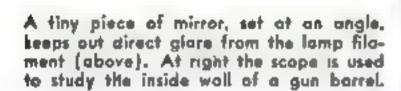

Callulose coment fasters the telescope lenses in their mounts—the metal ends of cardboard tubes.

Current for the little lamp behind the mirror is provided by dry culls. The connection is through a plug.

than the lenses will serve as the telescope body. In the instrument illustrated, cardboard tubes with metal ends—similar to small mailing tubes—were used. The larger tube, 1 3/16" in diameter, was 4%" long, and the inner tube, in diameter a sliding fit for the larger tube, was 3%" long. For mounting, holes slightly smaller than the lenses were cut in the metal ends with a punch and were brought to size with a tapered reamer. The lenses were then fastened with cellu-

lose cement. If cardboard tubes are not available, simple ones can be constructed by wrapping glue-coated paper around a window-shade roller or broom handle. The lenses might be cemented to cardboard rings cut to fit the tubes, and these rings held in place inside the tubes with glued locking rings. Be careful to mount the lenses parallel, with their centers in line. Paint the interior of the tubes a dull black. Then adjust the telescope to focus sharply on objects about 24" distant, and fasten it in place on the metal base with adhesive tape.

The next part is the mirror, which should be trimmed to fit its support, a strip of sheet metal cut from a tin can. Fold this strip in the middle, forming an angle less than 45 deg., and bend the edges of both sides—one side to hold the mirror and the other to fit around the base. Cement the mirror to the mount and fasten the mount to the base with a 2-56 machine screw. This screw-fastening permits removal of the mirror assembly when necessary to change the bulb.

Directly behind the mirror, at the end of the base, attach the flashlight socket, which should be trimmed of all extra parts, leaving only the threads and the end contact. Solder the threaded portion of the socket to the metal strip, tilting the socket slightly to provide room to insert the bulb. The end contact of the socket is soldered to one end of the magnet wire, which is then string along the metal strip and fastened in place with adhesive tape. The other end of the wire is spliced to one wire of the lamp cord, while the second lamp-cord wire is attached to the metal strip itself.

Power for the bulb is provided by two flashlight cells, mounted on a small wooden, block. Metal clips, again cut from a tin can, hold the batteries in place and serve as terminals. Wires run from the clip terminals to the wall receptacle.

To use the scope, plug it into the receptacle and insert it in the hole you wish to inspect. Focus on the image in the mirror, centering, if necessary, by flexing the metal strip slightly.

This scope should provide a clear, sharp view of interior surfaces magnified two or three times. For better performance, highergrade optical parts could be used. The mirror, for example, might be replaced with the type known as first-surface, that is, silvered on the front instead of the back, or with a totally reflecting prism like those used in good binoculars. The use of corrected, achromatic lenses in the telescope should add to the brilliance and sharpness of the image. For examination of very small holes a tinier bulb would be needed-miniature lamps such as the "gram of wheat" bulb developed for surgical instruments would let the scope fit into the barrel of a .22-cal. rifle.—Walter E. Burton.

Clouds over a law horizon add a feeling of spaciousness to this peaceful country scene.

### **AUTUMN...Time for Better Pictures**

#### IN THE FALL A FILM FAN'S FANCY TURNS TO OUT OF DOORS

### By Don Storing

BRILLIANT autumn often yields photographic opportunities of greater beauty and variation than any other season. The bright and varied colors in nature at this season afford unlimited scope for color shots. Subject matter and long shadows are also ideal for striking black-and-whites.

But, though fail can be your best photographic season, it can also be deceptive. Its clear air and vivid colors may lead you to believe that the prevailing illumination level is higher than it actually is. If you have a tendency to underexpose, this deception can cause disappointments. And other things can happen—things like blurred pictures from a moisture-laden lens, lowered print quality due to decreased contrasts caused by the softening sunlight, and damaged equipment if you neglect to protect your camera from rain or sudden cold.

Try to get colors, varied colors, in your fall color shots, like those in the color reproduction on page 113. Assorted hues are found in colorful clothing, brightly painted

boats, and cottages, farmhouses, and animals as well as in the turning foliage. Yellow and orange leaves will enable you to obtain bright "frames" instead of silhouetted leaf backgrounds so common in black-and-white prints.

The purple haze of autumn can also be very attractive, so don't always expose through a haze-removing filter. Take some photographs with and some without the

filter. You may like them all.

Be critical of your light, remembering the limitations of color film. Try various viewpoints until you find just the one that shows

the subject off to best advantage.

If you want to minimize strong contrasts, flat front lighting will, as its name implies, reduce them. Most of your color shots will probably require front lighting. And take care not to have too dark a background, such as one of evergreens.

When you want side or back lighting, make sure that the shadow areas are well illuminated by synchro-flash or reflectors. If you employ flash outdoors, be certain that

you have blue flash lamps designed for use with daylight-type color film.

In black-and-white photography, unnecessary limits are too often imposed on the choice of subjects when fall arrives. Burning leaves, hunters in the field, shocks of corn, and frosty pumpkins are not the only pictures. Though such scenes are available at no other time, autumn also provides ideal situations for placing a new and different interpretation on familiar subjects.

A cottage in which you spend many a happy summer vacation may be worth going back to in fall for a picture. The place will be deserted and will seem changed; but this may be just the difference that will contribute to an interesting and unusual photo-

graph.

Autumn and summer photography do not present the same problems, and some adaptations of technique may assist in producing more desirable black-and-whites. In some cases changes of equipment may bring better results.

Because the sun is lower, there is less light

A striking example of judicious use of fall lighting. The high horizon emphasizes the foreground detail.

Autumn is picnic time. Your own back yard may furnish such a rustic setting, and a young couple the important human interest.

Dry shocks of corn and barren fields yield prints possible only in autumn, but dan't feel you are limited to seasonal subjects.

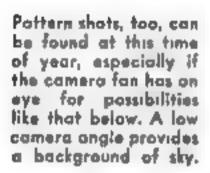

than in summer and the shadow areas are larger. You may want to consider exposing more for these long shadow regions, since they will occupy more of the view

Tend toward overexposure if you feel uncertain, but be on the alert to change your customary speed and aperture settings as circumstances dictate. Take dong a tripod. Nothing is so disconcerting as running into just the landscape you have been looking for all day—at twilight and without a tripod.

Landscapes tend to be monotcommon a composition unless certain precautions are observed. Black-and-white fall landscapes are often better when contrast is introduced, such as including an irch, a doorway, or the over hanging bough of a foreground tree as an appropriate "frame" for the scene. When these "frames" are silhouetted, they add interest, depth, and contrast

When shadows are long in fall, outdoors calls with many scenes like this. Use of a yellow filter brings out the cloud pattern, and a silhountted tree in the foreground adds depth for a fine study.

The correct use of filters can also be valuable. A yellow filter will hold back the blue light from sky areas to give a natural rendition of clouds. Greater-than-normal sky contrast may be obtained by exposing panchromatic film through an orange or red filter. Such "overcorrection" for landscapes will yield striking contrasts, making your prints pack more wallop and "carry" further.

Placing the horizon low often increases the effectiveness of outdoor composition. At other times the foreground may require the major space. It is rarely good to have the horizon at the middle.

Though the temptation to take a picture of an entire valley is strong, limit your view

to a more intimate study. There are exceptions, of course, but the "big scenes" are all too often disappointing in the print.

Photographs of trees are always appealing, and tree photography is a challenging hobby full of surprises and fun. The primary problem is one of isolating your tree without resorting to an ax.

When trees are scattered, a low camera angle may separate the selected subject from those behind it, lowering the horizon and providing a subdued background of sky and clouds. If the problem cannot be met by camera angle, use a wider aperture and a faster

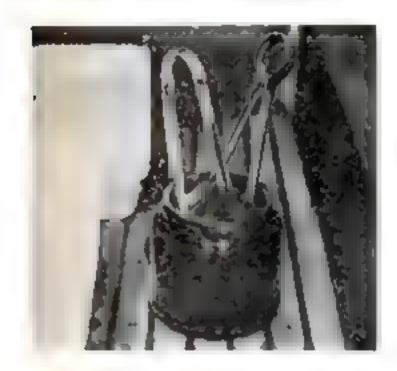

shutter speed to soften distant details by throwing them out of focus. The shallower depth of focus emphasizes foreground and subordinates background.

The haze of fall frequently creates ideal black-and-white mood situations. Distant views blend away into misty backgrounds sometimes, while at others sudden shafts of sunlight strike through to make patterns that most photographers dream of but seldom have a chance to catch on film.

Some of the most enthusiastic fall photographers are occasionally disappointed. But if proper attention is paid to the care of your equipment and changed demands, autumn can be your most successful season.

# PHOTO IDEAS and EQUIPMENT

PRINT TONGS will not drip developer all over your darkroom bench if you keep them in a glass jar. A jar that contained chemicals for I gal. of developer holds the tongs upright, handy for immediate use yet out of the way. Some fresh water in the jar rinses them at the same time, removing developer or shortstop solution.—Thank L. Bierwert.

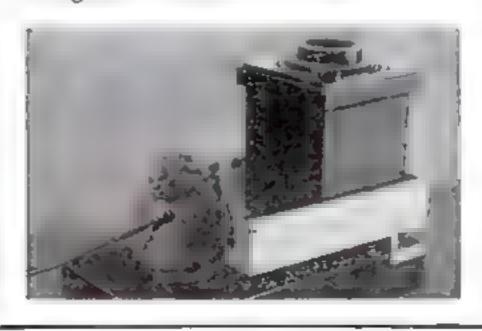

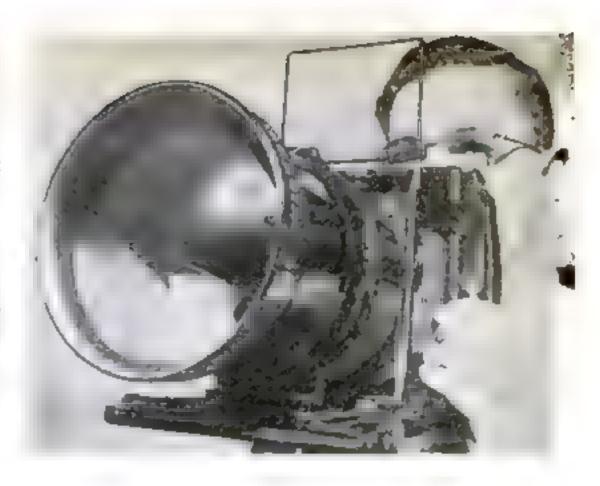

A NEW PROJECTOR for 35-mm. and 2" by 2" slides need never be removed from its case—even the screen can be set up at one end. The use of a short-focus lens gives large pictures without a long throw. Condenser lenses that do not have the conventional spherical curvature, used for the first time in an American-made projector, add sharpness and brilliance, claims the manufacturer, Viewlex, Inc., Long Island City, N. Y.

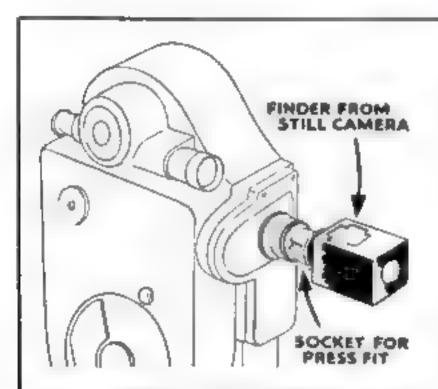

AUTOMATIC AGITATION. Two radio chassis and the motor from an oscillating fan were incorporated in this homemade filmtank agitator. The smaller chassis is pivoted at one end on angle brackets attached to the base chassis and tilted by the reciprocating arm.—George O, Smith.

conveniently on a simple wall rack made from a 36" piece of two-by-four and three lengths of 1%" closet pole. In cutting the poles, allow 3" for each six hangers. Fit poles into holes drilled in the board at an angle, fastening with finishing nails. Space the holes according to hanger size.—T. L. B.

BIG EYE, This 255-mm. lens. an f/2.3 Pan Tachar fitted with a special aluminum mount to adapt it to a 4" by 5" Speed Graphic, photographed Ordnance Department tests of rocket trajectories and flight characteristics under very poor light conditions. Since the mount replaced the standard lens board. all exposures were made with the focal-plane shutter. The designer of the big, high-speed rig, Zev Pressman, of the Alleghany Ballistics Laboratory, Cumberland, Md, is shown using it.-G. C. MACDONALD.

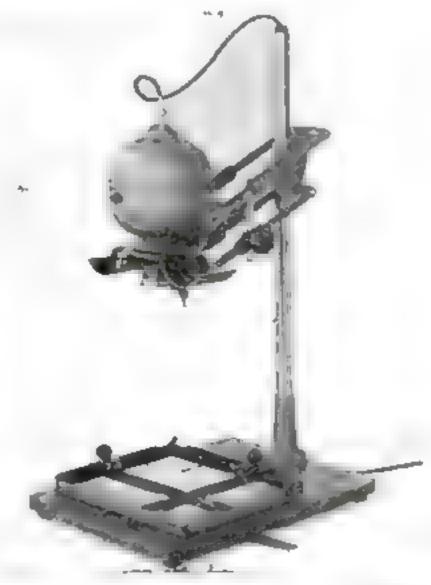

OFF-CENTER MOVIE TITLES can be avoided by using the waist-level view finder from a folding still camera to line up your work. Equipped with a socket to permit a press fit over the lens, the waist-level finder ends all parallax error.—C. M. HUNTLEY.

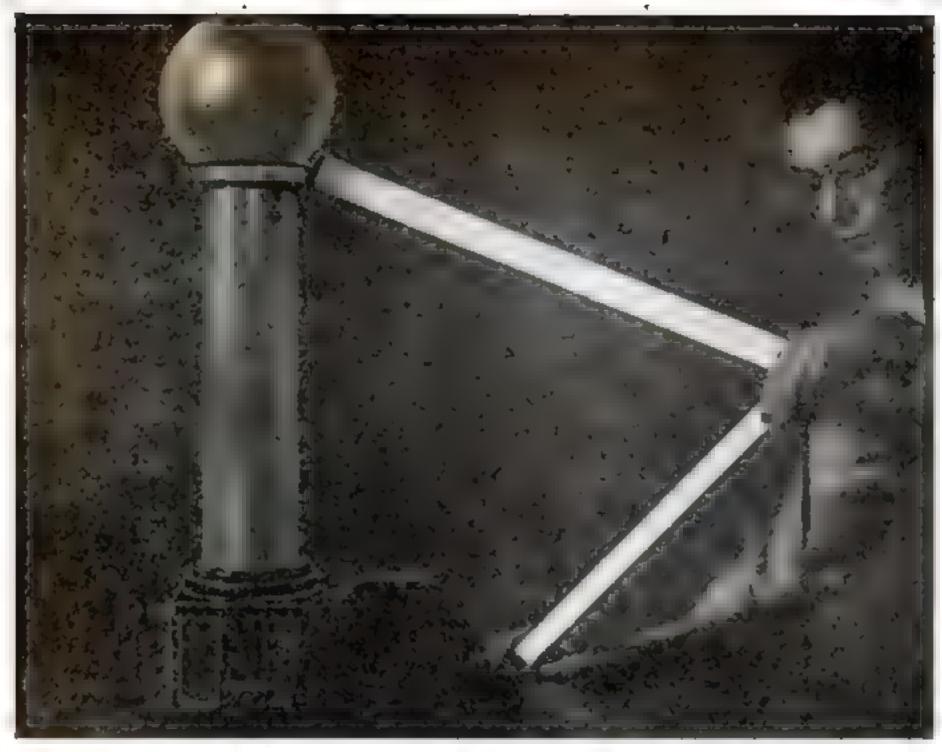

simplified enlarging is the promise of the postwar Leitz Focomat 1b, which has automatic focusing, conveniently located controls, large knobs, and a housing that tilts for quick access to the film and condensers. Automatic focusing through a range of 2% to 13 diameters is provided by parallelogram supports, with helical focusing available for greater enlargement. Although designed for 35-mm. film, the Focomat takes negatives up to 4 by 4 cm. E. Leitz, Inc., New York, is the maker.

PHOTOGRAPHIC SOLUTIONS

filter themselves, without supervision, in the Viking Filtorette. To remove sediment and dirt from a solution, it is poured into one bottle of the unit, which is connected to the second bottle with a special cap, vent tube, and filter disk, and the unit is inverted. Filtering is then automatic. Viking Products, North Hollywood, Calif., make it.

Static electricity escaping from the generator will light a chain of fluorescent tubes held and to and.

# Lightning in Your Hand

## EXPERIMENTAL MODEL OF A VAN DE GRAAFF ELECTROSTATIC GENERATOR CAN DELIVER OVER 100,000 HARMLESS VOLTS

By Loren W. Gay

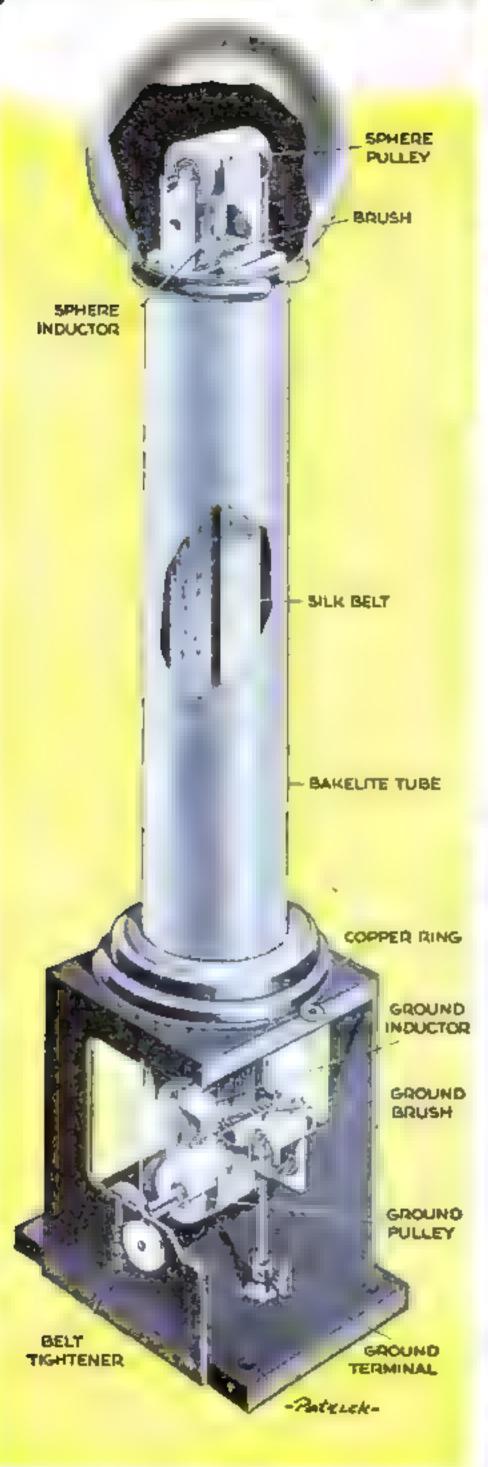

NUCLEAR physics, the unpredictable baby of the sciences, is about 50 years old. For the first two thirds of its short life it crawled patiently along on all fours. Then, without bothering to walk, it started to run. Just where it's running to, no one knows, but it has already revolutionized man's conception of his universe without even stopping for breath.

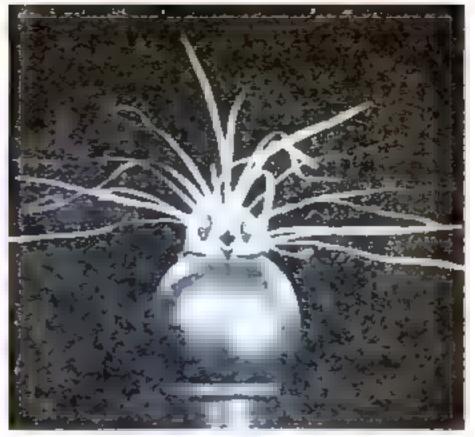

One of the mileposts in this swift race was the original of the electrostatic generator shown here. Neither surprising nor dramatic in its origin, the device was invented simply because it was needed: physicists wanted a controlled source of high-voltage D.C. in order to bombard the nucleus of the atom.

In 1931, Dr. Robert J. Van de Graaff went back to first principles to build a machine capable of delivering nearly 2,000,000 volts. Instead of rubbing amber and silk as the Greeks had done 2,000 years before, he revolved an endless belt in contact with metallic brushes.

The remarkably powerful model described in this article was designed chiefly as a laboratory-demonstration instrument. It is very simple in construction, and its exposed lower section permits a clear view of operation as well as effects. Before starting to build, procure the roller shafts, ball bearings, and the bakelite tube. If these vary from the dimensions given, you may have to alter some of the other specifications so that the parts will fit together properly.

Hard composition board was used for the two sides of the ground-pulley housing. Saw two pieces roughly to size, clamp them together, and drill and jigsaw the windows,

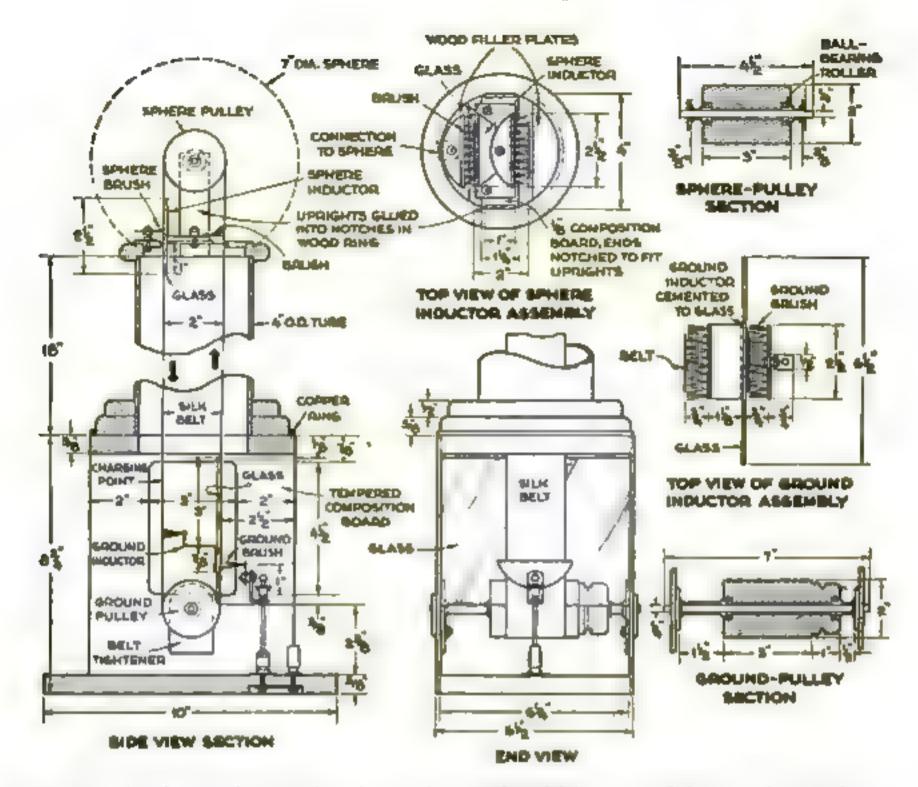

A popier-mache actopus looks friendly enough as he spreads his paper tentacles in the electric breeze.

slots and holes in both at once to insure perfect alignment. Slots for the pulley shaft should make a snug fit to prevent vibration, and the slots that will hold the ground-inductor glass must be cut so that the glass will be perfectly parallel to the silk belt and in light contact with it. It may be easiest to cut the glass first and fit the slots to it.

Cement and screw the base, sides, tube,

The sphere should rest snugly in the groove of the upper ring. Smooth the surface as much as possible.

Construction details given here are based upon the actual model but many of them may be varied to suit available materials. Output is governed chiefly by the length of the tube and the diameter of the sphere.

and the two lower wood rings together. The belt tighteners and the uprights for the sphere pulley are also made of composition board clamped together and finished in pairs.

For the rollers, use a good dry wood that is not subject to warping or cracking. Rough them on the lathe, then screw to the face-plate a scrap piece of 1" stock, and in it turn a hole that will make a tight press fit on one end of the roller. With the pulley chucked firmly in this hole so that you can work on the free end, turn a centered opening just large enough for the ball bearing to be pressed into place. Bore the shaft clearance hole part way through, using a skew chisel. Repeat these operations on the other end, and complete the shaft hole with a drill.

Prepare the other pulley in the same way. Test both rollers to make sure that they run true. Press the bearings and shafts in place, and clamp one shaft tight between the lathe centers. Belt the pulley to a motor so that it will spin on its bearings, and carefully turn

the wood down to a uniform diameter of 2". Turn a groove in the ground pulley for the driving belt, the sphere roller, of course, needs no groove. If the pulleys are out of true in any respect, it will be worth while to discard them and try again. Quality ball bearings good for a speed of 6,000 r.p.m., with an outside diameter of %", are recommended.

When assembling the pulleys on the shafts and on the machine, use washers and short pieces of metal tubing to space them out between the supports. Align the rollers with extreme care, and cement the upper ring on the tube.

Pure silk ribbon would be the ideal choice for the belt, but you'll probably have to settle for rayon. Set the tighteners to allow %" take-up, place the ribbon around the pulleys, and cut it to size, allowing about %" lap, Remove the belt, cement the ends together, and clamp the lap between blocks overnight.

When the mechanical parts are in satis-

factory running order you can proceed with the electrical parts-the brushes and inductors. Inductors are made of sheet aluminum or similar metal, cemented to glass plates. For the sphere inductor, cut a 24" by 24" piece of aluminum, bend it to a right angle, and cement it to a 2%" by 3%" sheet of thin window glass. Both are then cemented to the edge of a piece of composition board which is slotted to fit between the pulleysupporting uprights. Position this piece so that the glass plate will be parallel to and make light contact with the belt. A brush, which must make electrical contact with the inductor, is bolted to the same compositionboard strip, and touches the ribbon at the opposite end of the roller. The sphere brush completes the upper assembly; it is located directly behind the inductor and is separated from it by the ribbon and glass

To assemble, install the sphere brush, and drop a loop of the belt through the bakelite tube; then slip the inductor assembly in place between the uprights, and place the sphere pulley and shafts in the retaining slots. Insert the ground pulley through the belt, and adjust and tighten to run true. The ground inductor and its brush are made in one piece and cemented to the lower glass.

plate, which is placed in slots in the housing and held firm by wood disks screwed to the case to overlap the edges of the glass.

Brushes are made of sheet aluminum or copper (medium-size variable-condenser plates will do nicely) and short pieces of extrafleable stranded-copper wire or tinsel. Drill an even number of small holes parallel to one edge and spaced about %" apart. Loop a length of the wire through each pair of holes, and bend the metal back on itself to clamp the wire in place. Trim the edges to a straight line. Brushes should be cut to come as close to the belt as possible without rubbing or catching appreciably.

The sphere is a 7" metal map globe with an opening 4" in diameter cut in the bottom. File the edge of the opening so that the globe fits the groove in the upper ring; if the fit is good, no other fastening is needed.

Shellae or varnish all wooden parts of the machine; avoid paints, since some pigments are metallic and will reduce efficiency. When the generator is ready for trial, screw it to a solid base and belt the lower pulley to a 2-hp, motor so as to drive it at about 3,000 r.p.m. Connect the copper ring and the ground brush or its terminal to a good external ground.

[Turn the page.]

Adjust the belt tighteners until, at full speed, the ribbon runs smoothly in the center of both pulleys.

With the motor running, touch the belt lightly at the "charging point" with a rolled edge of celluloid or photo negative. Friction will knock free some of the electrons in the belt, imparting a positive charge. The missing electrons, however, are immediately replaced by the inductor brush, creating a potential between the latter and the ground brush, Between these oppositely charged plates, the glass acts somewhat in the manner of the dielectric of a condenser. Free electrons are attracted from the ground onto the ribbon, which promptly carnes the negative particles upward through the tube and into the sphere. Three or four complete revolutions may be necessary to build the charge on the sphere inductor to its saturation point. after which most of the electrons are carried around to the sphere brush where, by repulsion of the sphere inductor, they are kicked off into the metal globe. The celluloid charging sheet may then be removed and the generator will continue to build its own evele.

Once the sphere is fully charged, a number of interesting effects may be observed. Some are illustrated on these pages; others may come to you as a bit of a surprise. If you venture close to the generator when it is in proper operation, the tingling sensation you may feel will probably be due to hair standing up on your head or forearm. You can draw a spark to your finger or to any metal object held near the sphere. In a darkened room you will be able to see the static electricity streaming from the ground brush onto the belt, and from the ground in-

Carried down the stiff upright wire to the pivot, static electricity drives the pin wheel briskly.

ductor up over the glass plate to the belt, or from one side of the belt to the other.

Measurement of actual voltage is extremely difficult, so no attempt was made to obtain a proper rating of this unit. Under favorable conditions the spark effects that are observed suggest an output in excess of 100,-000 volts.

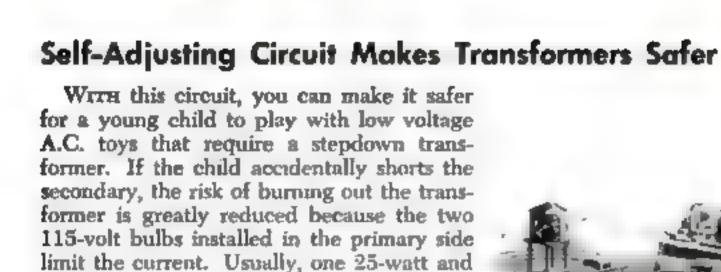

Favorable conditions, by the way, include a dry climate, since moisture encourages the charge to leak off into the atmosphere. If you live in high, dry territory, you can get results the year found. If not, you'll have to do your experimenting when the weather man gives you the nod, or when winter's steam heat cooks the moisture out of the air.

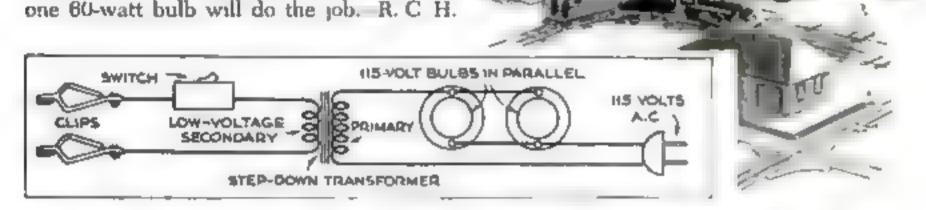

Smake-filled jars can be cleared quickly. Pins soldered to the lower half of the ball-tipped rad dissipate the charge; the electrified smake particles repel each other, and are deposited on the walls of the jar.

### Four-Way Toggle Switch Employed to Reverse Induction Motor

A SIMPLE method of reversing an induction motor is illustrated in the accompanying diagram. It involves use of an ordinary four-way toggle switch, which is, in effect, a D.P.D.T. switch.

Since the switch carries current only during the starting period, it need not be one having a heavy-duty rating. Even if the motor is running, the reverse switch may be thrown and no damage will result since the starting winding is open. The regular line switch is used for "off" and "on".—H. J. W.

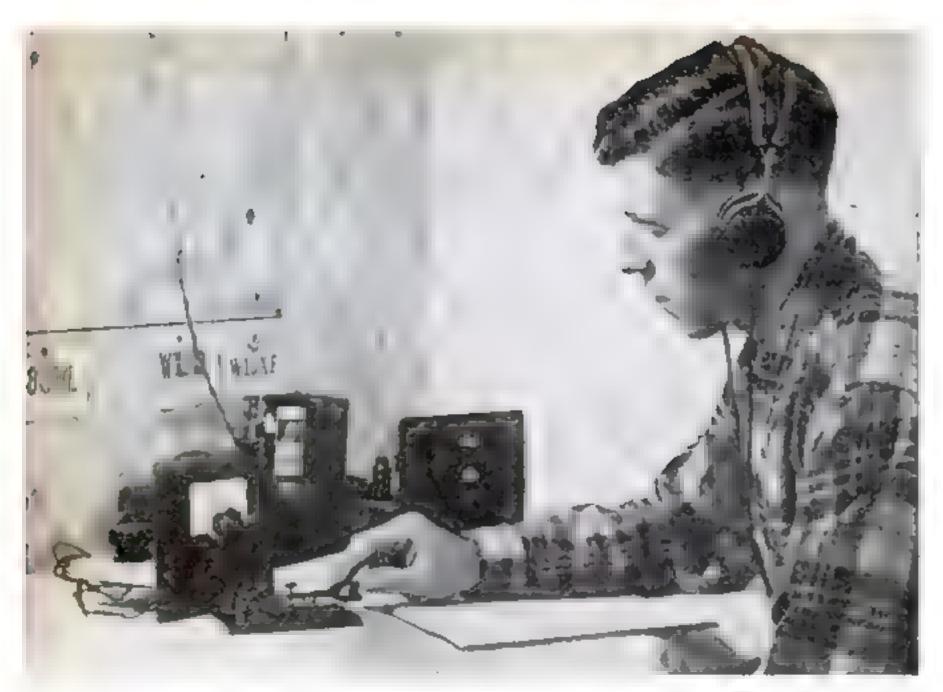

### Yard Light and Electric Wires Supported on Tree-Fork Pole

White on a recent visit to a farm, I came across a novel idea for a yard light and a supporting pole for the electric wires between the house and barn. The pole, about 8" in diameter at the base, had been cut so as to retain the first major fork of the original tree. One prong provided a mount for a light that could be operated either from the house or barn, as the diagram shows. The other supported the wires. Painted tin cans were fitted snugly over the fork ends to prevent decay.

The light consisted of a reflector and socket fixed to a short length of %" electric conduit bent in a J shape and attached to the pole with two %" pipe straps. A bushing screwed on the other end of the conduit prevented the metal from cutting through the insulation. Knob-type insulators held the

wires - JOHN W. LA LONDE.

To check the frequency of your signal, separate your receiver and transmitter, and listen in an yourself.

### GET STARTED IN HAM RADIO WITH THIS

# Midget 80-Meter Code Transmitter

By CLINTON E. CLARK

ARADIO "station" hardly bigger than a shoe box is an ideal rig in many respects. If you've just obtained your license, you can use it to get on the air at the cost of a few dollars and even fewer hours. On the other hand, if you're an old timer operating a more elaborate phone transmitter, here's a quick and inexpensive way to renew your acquaintance with the fast-fingered hams who keep the code bands clicking.

Despite its size, this transmitter is capable of real performance. Just bear in mind that the 80-meter band is crowded with high-powered outfits, so you'll have the best chance of getting through during the relatively quiet hours.

tively quiet hours.

For the baseboard, take a piece of \$" by 5" by 7" wood and center the tube socket and six-prong crystal holder on a line 2%" from the rear. Raise the socket on \$" sleeves or small insulators, and drill a \$" hole under

it to pass the filament and cathode wires. Fasten a six-lug terminal strip along the rear edge of the wood.

To make the plate coil, L3, wind 38 turns of No. 20 D.C.C. wire on a 2" dia. form, spacing the turns to a length of 3". This coil is center tapped, as indicated in the diagram, and has a two-turn coupling coil wound over it. The antenna coil, L4, is made in the same way except for the omission of the center tap. Mount the plate coil alongside the tube socket on a pair of standoff insulators.

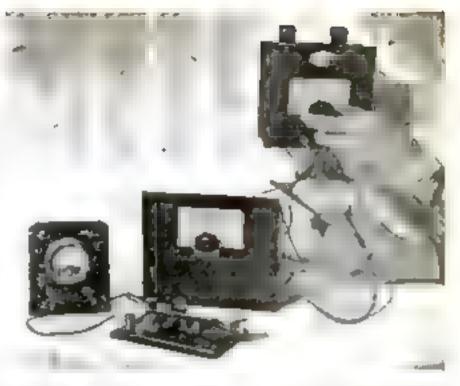

The antenna tuning unit is the electrical counterpart of the coil-condenser circuit in the transmitter. Front and rear panels are made of 5" by 6" by 6" composition board separated by 5" dowels 3" long.

When the wiring is completed, connect the transmitter to a power supply capable of delivering 250 to 300 volts to the plate, and 6.3 volts to the filament. Shunt a 0-to-200 milliammeter across the keying circuit as shown in the diagram, and, with the tube

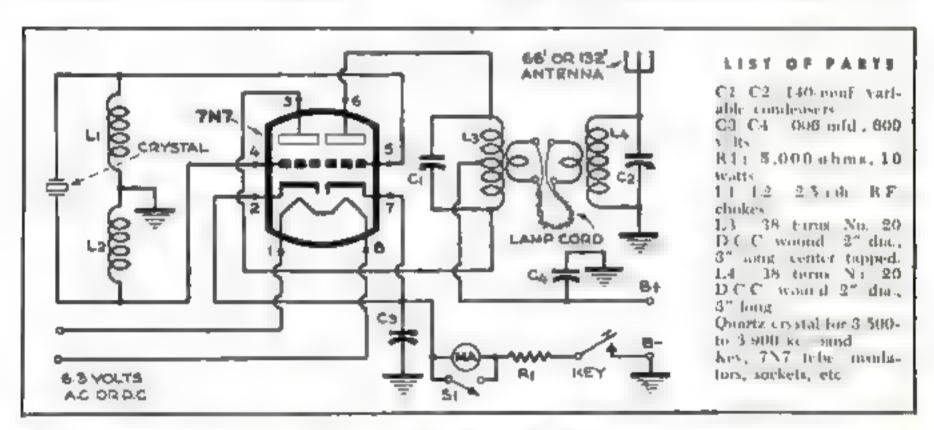

lit, apply plate power by closing the key. The meter needle should rise sharply, but as the plate circuit is tuned to the operating frequency of the crystal, the meter will

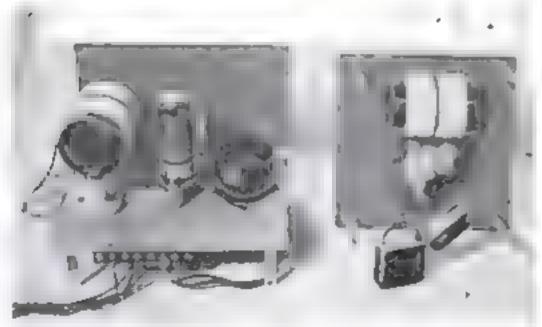

register a downward dip.

The next step is commonly called "loading the antenna." Connect twisted lamp cord between terminals y-y of the transmitter and antenna unit, hook up the antenna and ground, and rotate the antenna-tuning condenser. With the key closed, the meter needle will rise when the antenna is in resonance with the transmitter. After loading the antenna, it is sometimes necessary to return the transmitter slightly. Another method is shown at the right. The bulb should be brightest when the transmitter is tuned to resonance, but the light decreases as the antenna is closed.

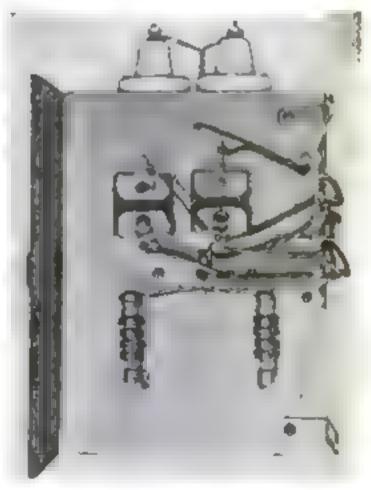

An alternative antenna-tuning method consists of connecting a loop of wire to a nean or Christmastree bulb, and holding the loop near either end of the plate cail. Energy in the cail lights the bulb.

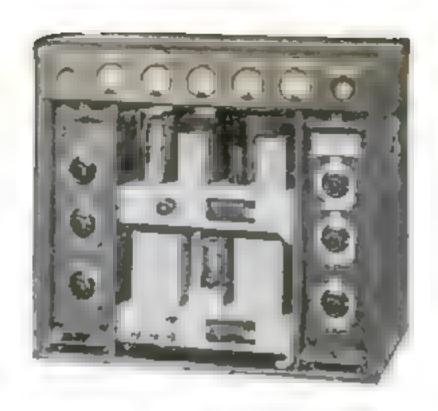

Legs for the transmitter are formed by two metal angles in back, and the bottom of the panel in front. The two stand-off insulators at the far left support the link-coupling coil, which is made of two turns of insulated wire around the center of the plate coil. Underseath the baseboard, mount the two R.F. chokes, the two by-pass condensers, and the 5,000-ohm cathode resistor, as shown at the right.

# NEWS IN ELECTRONICS

LOW-POWER COMMUNICATION for airports is provided by a complete 50-watt radio station made by Aireon Manufacturing Corp., of Kansas City, Kans. The transmitter, right, and its associated receiver are crystal controlled and tuned by push buttons over several frequency ranges.

A TINY MICROPHONE, above, recently developed by Bell Telephone Laboratories, approaches the ideal size for a point pick-up device. Phase distortion due to sound waves striking different portions of the diaphragm is practically eliminated by its small diameter. It is generally used with the amplifier shown above.

MAGNETIC STORMS, extremely prevalent along the direct route from New York to Moscow, will be by-passed by a new radio relay station built by RCA Communications, Inc., in the International Zone at Tangier. The relay station provides a means of insuring uninterrupted service between the two world centers when short-wave signals are blocked by sunspot-generated disturbances. The new route is 1,300 miles, or 1/140 second, longer than the old.

COAXIAL-CABLE CONNECTORS make it easier to obtain water-tight joints on feed bines for high-frequency antennas. Intro-

duced by Barker & Wilhamson, of Upper Darby, Pa, the connector, right, is made of aluminum with steatife insulation. Weatherproof cement, rubber tubing, and a set of screws are supplied with each unit.

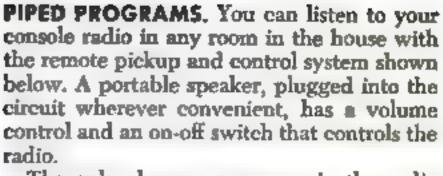

MUSIC FOR TWO BITS will shortly be offered to hotel guests by Radio-Matic of America, Inc., who will distribute this coin-operated General Electric radio. A quarter in the slot provides two hours of entertainment; since the electric timing device operates only while the radio is on, the two hours represents actual listening time. Now you'll be able to save money by switching off the commercials.

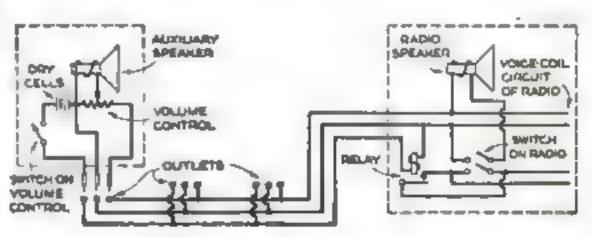

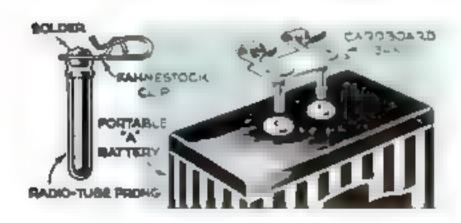

You can listen to your best radio from any room with this system.

The only changes necessary in the radio itself are the installation of a new power switch with an extra pole, and a relay for remote on-off control. This relay, of about 1,000 ohms resistance, should operate on two or three flashlight cells. Low-voltage conductors such as bell or magnet wire will do for the house circuit. The portable speaker—more than one could be used—is a permanent-magnet type; mount it in a housing with a combined power switch and volume control of 1,000 to 5,000 ohms resistance. This adjusts the remote speaker without affecting the radio—Willard Allerian.

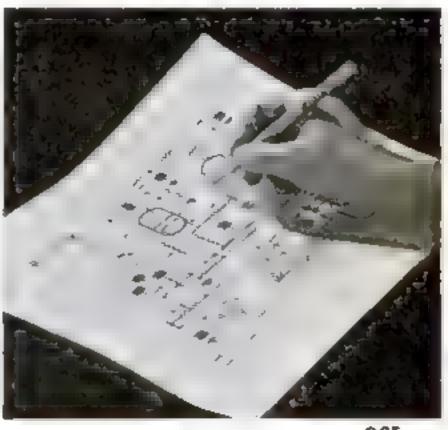

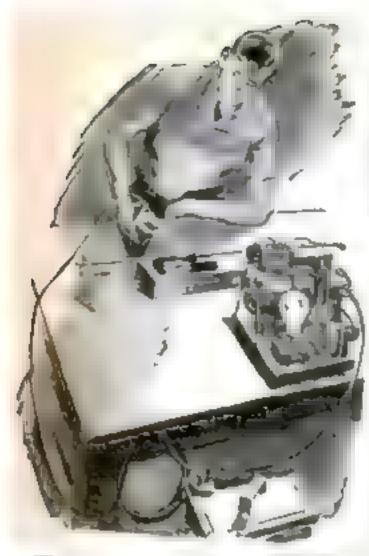

PLUG-IN ADAPTERS. Prongs from burnedout radio tubes secured to a cardboard base enable you to connect plug-in type portable radio batteries anywhere. Three prongs are needed for a "B" battery having a 22-volt terminal. Make sure the leads can't be accidentally shorted.—C. E. WARD III.

are quickly made from slipon pencil erasers. Drill the hole right through and round off corners on an emery wheel. Cement will hold it on the wire.—Al. M. LINDNER, JR.

LEST YOU FORGET which part of a complicated wiring job has been finished, run a colored pencil over the lines on the circuit diagram as you wire in each one. Then there is no need to trace wiring to learn what is left to do. It's also a help in preventing wiring mistakes.—John Borodich.

The throttle valve of the mean engine controls air flow. A samp in series with the motor seduces speed.

### Alcohol Blowpipe Is Powered by Miniature Air Compressor

INTENSE heat, concentrated in a needle of blue flame, is instantly available from this tin-can lamp and blowpipe. Ideal for delicate soldering, the torch will also handle jobs too big for a 75-watt iron. With a charcoal block and asbestos-paper shields, it will even silver-solder small parts.

VACUUM CLEANER

60-WATT

⊚

Cut the top off a tin can and cut a disk of extra-heavy tin-can stock to replace it. Punch a %" filling hole in the disk, solder a %" nut underneath, and in a slot solder a wick holder made from tin-can stock. Pack the can with cotton and lamp wicking and solder the new top in, having first inserted a stud and top nut to keep the under nut from loosening while hot.

For the blowpipe use the barrel of a me-

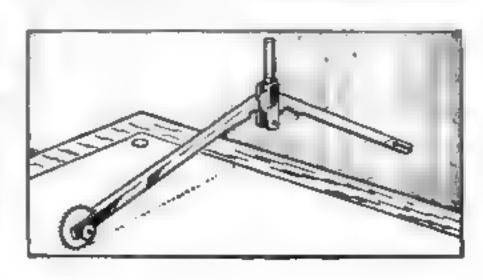

chanical pencil. A bracket soldered to the can and another bent around the pencil permit adjustment to obtain the best flame.

Attach a length of windshield-wiper hose, trim the wick to about 1/16", and fill the can two-thirds full with alcohol. Light the wick and adjust the nozzle until gentle, steady blowing in the tube produces a pointed blue flame about 3" long.

For prolonged work I've rigged up a single-cylinder, single-acting model steam engine to be driven backward as an air pump. A 5-gal, can acts as an air dome to level out pulsations, while a discarded vacuum-cleaner motor drives the "compressor." To hold the motor to a few hundred r.p.m., wire several resistors in series with it.—F. R.

### Compass Used as Pattern Wheel

By REMOVING one of the small screws from a drafting compass and inserting a watch or clock gear of suitable size, a pattern wheel or stitching spacer can be made. The screw is replaced to serve as an axle for the gear, and the compass legs are spread to full width.—G. E. HARRINGTON.

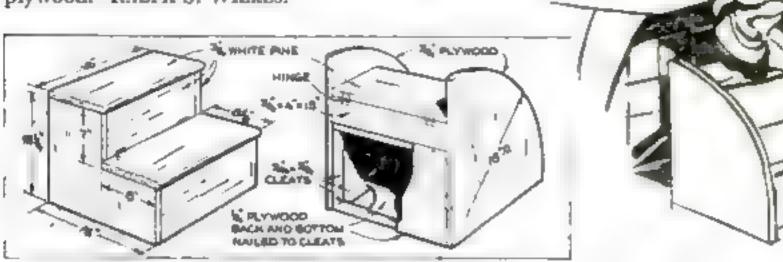

### Combination Steps and Toy Chest Help Child to Help Himself

 INDEPENDENCE in a child in such things as washing hands and brushing teeth is developed by providing a means for the youngster to reach the wash basin. This two-step stand is also a small chest in which can be kept toys, pajamas, or towels.

Waterproof X" plywood is ideal for sides as it won't warp even in a steamy bathroom. Fill the edges to provide a smooth surface for an enamel finish. Steps may be cut from solid "" or 1" pine and are hinged. The back and bottom may be "

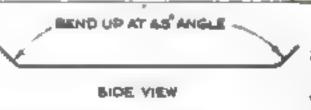

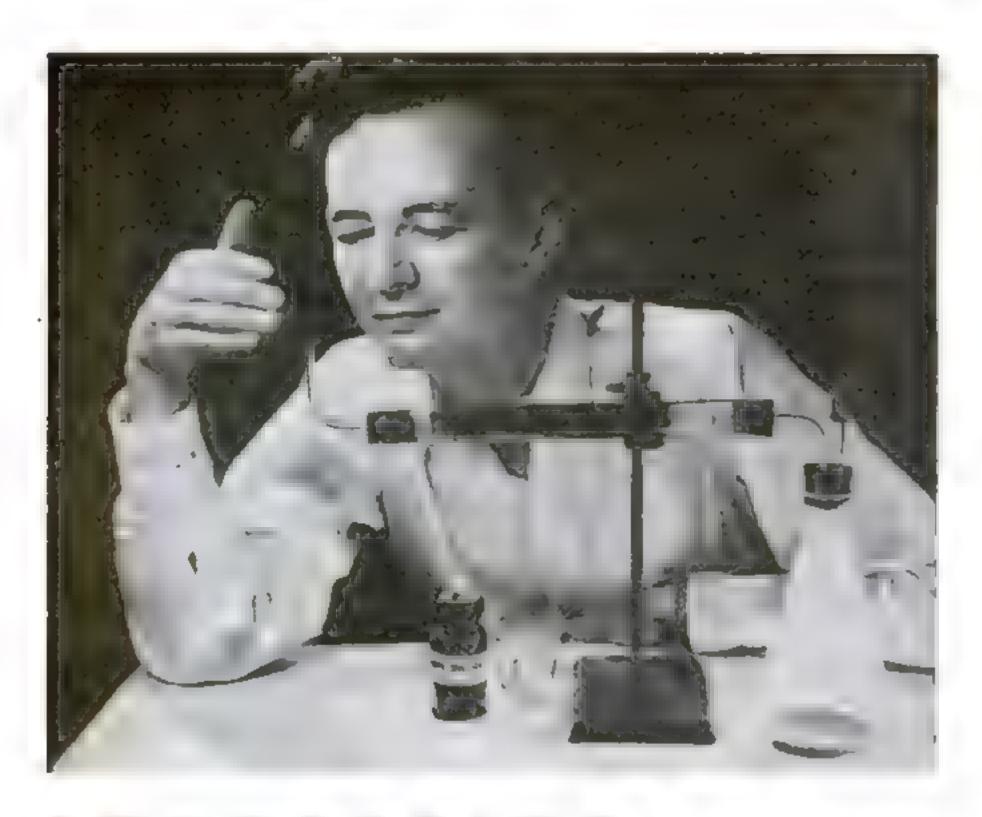

### Flat Paint on Radiators Increases Heat

BETTER radiation, and consequently more heat, can be coaxed from your radiators this winter by repainting with flat wall paint. A bulletin from the National Bureau of Standards states that nonmetallic flat pault is 165 percent more effective on radiators than metallic paints such as bronze or aluminum. And to make it easier, so you won't have to scrape off old paint, only the top coat influences radiation.

The color of the paint also has its effect on heating efficiency, with white giving off most heat. Cream, red, gray, yellow, black, aluminum (color only), and brown then follow in the order named.

### ADSORPTION is the word!

### And Though It's Still a Mystery, Chemists Make It Work Modern Wonders

By KENNETH M. SWEEZEY

EVERY time we use blotting paper on ink, talcum powder on a grease spot, or the white of an egg to settle coffee grounds, we evoke the mysterious property of adsorption. Although the "why" of this phenomenon is imperfectly understood, its practical application produces amazing results in industry.

Unlike absorption, which means the taking of one substance into the body of another (like water into a sponge), adsorption pertains only to thin concentrations of one substance on the surface of another. As it is a purely surface effect, adsorption is observed best in substances that are finely divided or highly porous. Charcoal, salica gel, activated alumina, and fuller's earth are among the most important adsorbents. By

trapping specific substances on their surfaces, they remove unwanted colors, tastes, and odors from drinking water, food products, chemicals, and drugs. In like manner they help recover gases and solid and liquid chemicals that otherwise might be lost in certain industrial processes.

Activated carbon and silica gel (a porbus form of silicic acid made by reacting hydrochloric acid with sodium silicate) are used to trap odors and moisture in air-conditioning systems and to dry the air in packages of machinery. Small containers of these adsorbents can sidetrack undesirable food smells that sometimes are found in the home refrigerator.

Surface catalysts owe their properties to adsorption. By catching molecules of two or more different substances and holding them tightly together, they promote reactions

Polsonous gases and obnazious adars can be trapped by adsorption on the surface of activated charcoal, used in gas masks. On the facing page, the bad-egg stench of hydragen sulphide is held by powdered charcoal in the large tube and can't be detected at the outlet, but disconnect the generator and heat the charcoal, as above, and the odor is immediately apparent.

that would not occur in the ordinary association of these substances. Synthetic ammonia, sulphuric acid by the contact process, and hydrogenated oils are a few of the industrial products that are made possible by adsorption.

Most war gases and many odors such as those of garlic and cabbage can be trapped by adsorption on charcoal. You can easily prove this by removing from circulation a gas that, as normally experienced, makes a

remarkably obnoxious odor.

Set up a simple hydrogen sulphide generator by dropping I gram of iron sulphide into a flask, covering the bottom with %" of water, and stoppering with a two-hole stopper—one hole provided with a delivery tube bent at right angles and the other to admit a medicine dropper. Your adsorption apparatus may be a 1" by 12" glass tube filled with granular or powdered charcoal held at each end by a wad of loosely packed absorbent cotton. Clamp this tube horizontally to a ring stand and connect one end through a one-hole stopper to the gas generator. Fit a similar stopper in the other end with a bent outlet tube.

The best charcoal for gas masks is made from coconut shells. Charcoal from fruit pits, walnut shells, hardwood, and even hard coal has punch-hit—effectiveness decreasing in the order given. All are made tremendously more efficient by actiontion, generally a process of heating in steam and air to drive off adsorbed hydrocarbons.

For your experiments, almost any powdered or granulated charcoal will do. If it has not been activated, it can be made partially so by heating to redness in a crucible and then

cooling just before use.

Fill the medicine dropper with concentrated hydrochloric acid and squeeze it into the flask through the hole in the stopper. Refill, squeeze again, and then press the dropper in tightly to seal the hole. The acid will react with the iron sulphide to form hydrogen sulphide.

After the gas has been generated for a minute, waft it from the outlet tube toward your nose. If your charcoal is good and the setup correct,

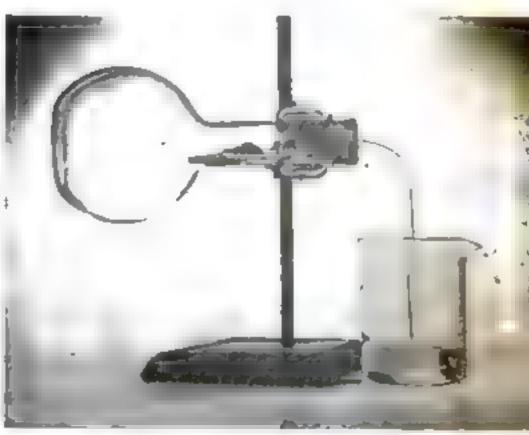

you will smell nothing.

Disconnect the flask and plug that end of the charcoal tube; then

heat the tube gently with an alcohol flame and waft some more of what issues toward your nose. The warmed charcoal releases the adsorbed stench.

To find out how charcoal clings more tenaciously to some gases than to others,

Charcoal here adsorbs ammonia gas in a flask. The resulting partial vacuum draws up all in the tube.

Put a few drops of ink in a glass of water and add a little alum and household ammonia. The gelatinous precipitate of aluminum hydroxide formed adsorbs the color and carries it down as it gradually settles.

repeat the experiment with other gases. Laboratory tests indicate that activated charcoal can adsorb seven times its own bulk of hydrogen, 25 of oxygen, 64 of carbon dioxide, 200 of ammonia, and 300 of chlorine.

The adsorbing power of charcoal can also be demonstrated visually. Fill a flask with ammonia gas by pouring a little strong ammonium hydroxide in the bottom, letting

it stand a few minutes so the ammonia fumes will drive out the air, and then inverting to pour out the liquid and stoppering while the flask is still inverted. Mount the flask horizontally and place nearby a new stopper with a bent glass tube and a beaker of oil.

Remove the first stopper, insert a folded strip of paper containing a heap of powdered charcoal, and put in quickly the stopper with the bent tube. As the charcoal adsorbs the gas, it produces a partial vacuum that causes the oil to rise in the tube.

Adsorption of one chemical substance by another finds im-

portant use in dyeing. Colors that ordinarily will not be retained by a textile can often be made to stay by first treating the textile with an insoluble chemical that adsorbs the dye. Aluminum hydroxide is such an adsorbent.

You can demonstrate the effect by adding a few drops of a suspension of indigo or alizarin or ordinary black ink to water in a tall glass. Next, dissolve % tsp. of common alum in the water, and then stir in % tsp. of household ammonia. Clumps of colored matter will appear with clear spaces between them, and they will settle gradually, leaving the upper part of the water clear. What happens is that the alum (potassium aluminum sulphate) reacts with the ammonium hydroxide to form a gelatinous pre-

cipitate of aluminum hydroxide. This adsorbs the coloring matter, which is carried down as the precipitate settles.

Adsorption is one means by which iodine is recovered from brines from petroleum wells and from brines worked up for salt. Color a glass of water strongly with fincture of iodine and stir in thoroughly I tsp. of activated charcoal. Then filter the solution. Clear water will come out, and the iodine will remain bound to the charcoal. The odor of sauerkraut, the color of brown sugar, and the odor and color of dark vinegar can be removed from solution by the same pro-

cedure as that used for the iodine.

In industry, thousands of tons of adsorbents are required each year for important manufacturing processes. In our modern life, we could do without them only with the greatest difficulty.

So remember this word that looks like another but means something different.

Charcoal takes indine out of solution, and the liquid will come through a filter amazingly clear.

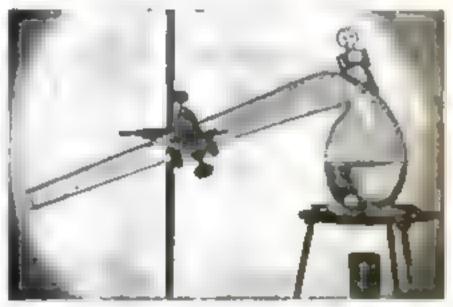

### Can You Identify These Pieces of Laboratory Equipment?

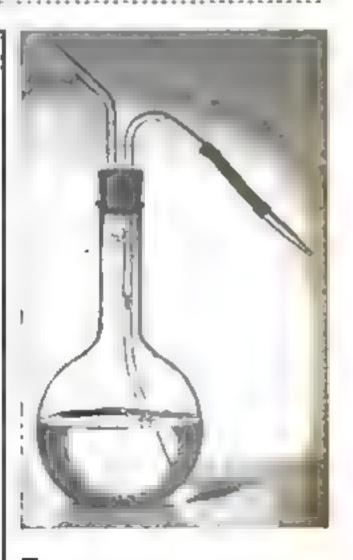

Anyone familiar with a chemistry lab will have no difficulty in identifying the equipment shown here. Write the names in the spaces provided; then turn the page upside down and compare your answers with the correct ones given below.

- 6. Drying tube. 7. Wash bottle.

### One-Car Garage Is Spread Apart to Accommodate Second Car

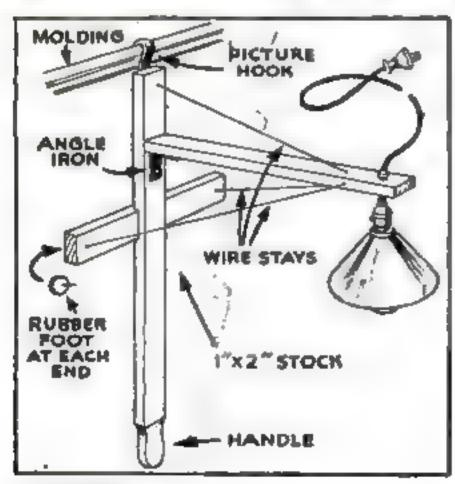

Most home owners with one-car garages worry along and just wish they had room for a second car when overnight and weekend guests arrive. Ira Vail, of Port Washington, L. I., did something about it. He split his narrow garage in two, shoved the

two sides apart to required width, and filled in the center portion. How he did it and the result—with the two cars there—are shown in the photos below. The job is one that should be tackled only by carpenters or others experienced in construction work.

- 1 Here the stucco finish is first broken away on the centerline to expose the wood for sawing.
- 3 A long beam is put across the double door, the rafters extended, and the ridgeplate replaced.

- 2 Then both sides are propped up, the ridgeplate is taken out, and half of the garage is moved.
- 4 Open parts of the frame and roof are filled in finally, and shingles and finish are completed.

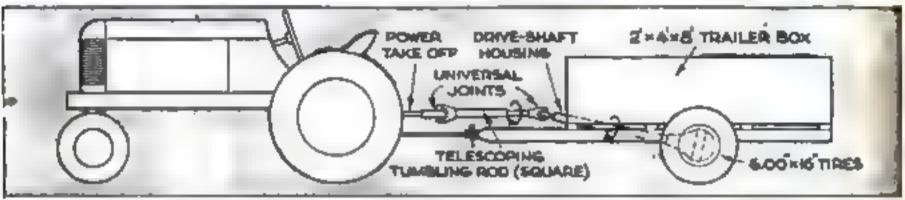

### Portable Workshop Lamp Hangs from Molding Along Wall

This lamp is especially useful in the shop because it can be quickly moved to any spot where light is needed and hung on the wall molding. Its portability is limited only by the length of cord and the location of electric outlets.

Attach an arm to an upright piece, securing it with an angle brace, and screw a picture hook to the top for hanging on the molding. A crosspiece lap-jointed on the vertical will keep the arm, from swinging, while a handle turned or carved at the lower end provides a grip for moving the lamp. Wires from the vertical piece and crosspiece stiffen the arm,—Otto Woolley.

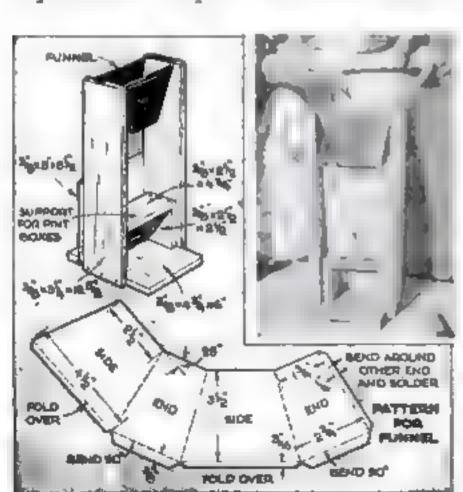

### "Shove Buggy" Pushes Old-Model Tractors to Higher Road Speeds

EVEN a tractor can be "souped up." Older farm machines, formerly limited to a road speed of five or six mp.h., are now cruising highways at 12 to 15 mp.h.—pushed by powered trailers. The trailer, with a passenger car rear axle driven through the power takeoff of the tractor, does the work while the tractor coasts in neutral. Good roadability is reported.

Originated by South Dakota wheat farmers envious of neighbors' late-model tractors, which have special gears for road speeds up to 20 m.p.h., the "shove buggy" requires few new parts. The drave shaft is

removed from the passenger-car rear end and the spline cut off. Then enough smooth shafting is welded on so that the modified drive shaft projects beyond its housing about 2". A straight roller bearing is inserted between the shaft and housing, and a grease fitting installed for lubrication.

Heavy U-bolts fasten the axle to a standard farm trailer. The drive shaft housing talts up slightly, emerging above the front crosspiece through a notch in the front gate. A telescoping shaft equipped with universal joints connects the drive shaft to the power takeoff.—John N. Olson.

### Box Filler Aids Home Freezing

ALREADY one of the simplest of home preserving methods, deep-freezing operations can be speeded up still more with a combination holder-filler that packs cellophane-lined quart and pint freezer cartons at production-line efficiency. For the holder illustrated, which was scaled to fit the available boxes, %" stock was used, although " plywood might be substituted for the sides. The removable platform, shown here in use, raises pint boxes high enough so that no food is spilled in packing. The sheet-metal funnel was cut from a tm can, following the pattern at left. Its edges were rolled over as a safety precaution, and the funnel soldered together. It is nailed in place by two edges.-RALPH S. WILKES.

## Roving Molecules Create Diffusion

SOME SOLIDS are easily distinguishable by their odor, indicating that these substances diffuse molecules into the air. Naphthalene, of which moth balls are made, is such a material. Place a moth ball and a bit of butter in a far, as at right, cap the jar tightly, and leave for several hours. The butter will then itself carry the odor of naphthalene. Leave the ball in the open long enough and it will eventually disappear without a trace.

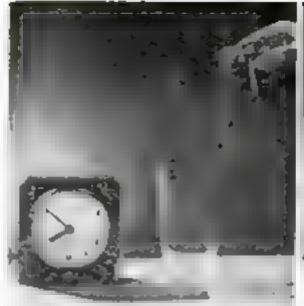

GAS MOLECULES, always in rapid motion, diffuse even through porous solids, the rate of diffusion varying inversely with the square root of the gas density. In other words, light gases diffuse faster than heavier ones. You can demonstrate this with the equipment at the left—an unglazed flower pot sealed at the top with a cardboard disk and wax, Jshaped tubing sealed into the bottom hole, and colored water in the tubing to serve as a pressure gauge or manometer. First, cover the pot with an inverted beaker and introduce illuminating gas. Immediately, the water in the long leg of the tube is depressed, indicating the pressure inside the pot is greater than that of the outside air. The reason? The gas diffuses through the porous walls faster than the heavier air inside can get out. Now reverse the diftusion by removing the beaker. Your manometer will show that the pressure inside the pot falls below atmosphere pressure.

WEIGHT isn't the only explanation when heavy gas diffuses downward through a light gas, for in this experiment you can make a heavy gas diffuse upward and a light one downward. Molecular movement is the answer.

First place a few drops of hydrochloric acid in a tumbler to produce the heavy gas, hydrogen chloride. Then, some distance away, put several drops of household am-

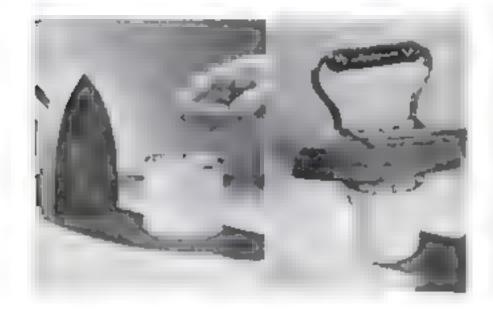

monia into another tumbler, swishing it around and finally draining off the excess. These fumes will be the light gas, ammonia.

Now quickly invert the second glass over the first, as above. In only a few seconds,

both glasses will fill with a cloud of ammonum chloride particles. These are produced by reaction of the two gases when molecules of the heavy hydrogen chloride move upward and light ammonia molecules go downward.

LIQUIDS DIFFUSE more slowly than gases because the movement of liquid molecules is not nearly as great. An experiment to show the slowness of diffusion between a heavy liquid placed below a light one is easily set up. Half fill a glass with plain water, and then introduce a strong solution of salt water underneath by pouring it through a funnel

MOLECULES OF LIQUIDS also are in constant motion. As a result, one liquid will diffuse through another with which it is miscible and through porous solids. Fill a can with dried peas, pour in water to the brim and weight the friction top with an iron. In a few hours, the swelling peas will lift the iron. Why do the peas swell? Because the water, being less dense, enters faster than the solution of solids inside can get out. The result is greater pressure inside than out, and the peas expand.

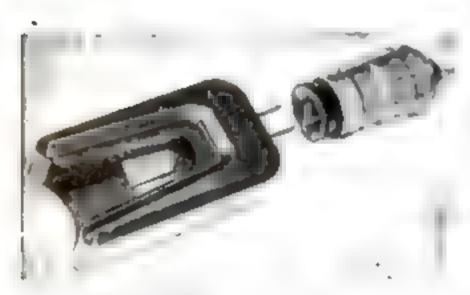

held near the bottom of the glass. Fill a small vial with enough water so it barely sinks in plain water. Thus prepared, the vial will float on top of the salt solution and indicate the line of separation of the two liquids. Cover the glass and place it where it won't be disturbed. A week later the vial still will not have reached the top.

# FOR EASIER FARMING

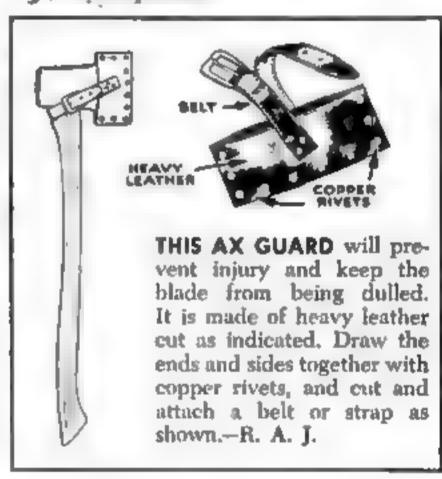

AN ASPHALT POWDER MIX distributed by the Rand-Williams Manufacturing Co., of New York, has many uses around the farm and the home. With an oil solvent added, it can be used for such jobs as repairing leaky water troughs, patching roof leaks, coating roofs, waterproofing fence posts, waterproofing cellar walls, as a caulting compound, and as a fireproof coating on furnaces and pipes. Known as Mixtite, the product also is supplied in the form of a red or aluminum-colored paint.

ELECTROCUTION is one of the newer ways to get rid of mice. An electric mouse trap made by Ratchford Engineered Products, of Dayton, Ohio, operates on regular house current. Two side electrodes and two base pads kill the mouse, and reflex action is then said to throw the body clear.

FORTABLE POWER for a variety of jobs is provided by the Aspen Drive-All, a transmission unit operating from the rear wheel of a car. The basic unit, consisting of ramp, rollers, and main power-shaft housing, weighs approximately 65 lb., and is small enough to carry in the average automobile trunk compartment. Four interchangeable adapters are available for use with the unit. A pulley adapter comes with each Drive-All and is suitable for operating a saw, pump, spray outfit, or blower. Other accessories are a generator to power hand tools and supply emergency power, a centrafugal pump, and a tool grander. Aspegren Manufacturing Co., of New York, makes it.

### With flash-equipped Kodak, you're set to shoot anywhere, any time

#### **Elastics Cut from Rubber Gloves**

RINGS sheed from the fingers, wrists, and palms of rubber gloves that have been snagged and are no longer leakproof provide a supply of 50 to 100 rubber bands of good grade. Bands may be cut with scissors to any desired width.—R. N. BUCKMASTER.

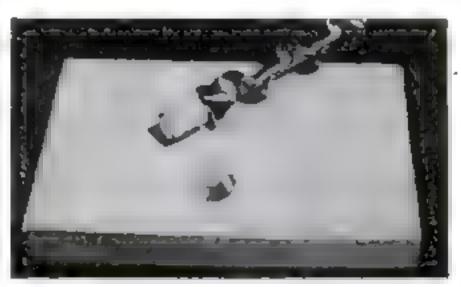

#### Bit Ground for Hand-Drill Use

WHEN a square-shank bit intended for use in a brace is needed also in a hand drill, a portion of the shank can be ground round to enter the chuck. A %" length at the end ground to a diameter of about 7/32" is satisfactory, and enough of the square head is left for use also in the brace when there is need.—G. W. E.

#### **Dowel Guides Counterboring Bit**

A USEFUL guide for reboring or counterboring holes can be made from a hardwood dowel of the same diameter as the original hole. Cut about a %" length of the dowel square at the ends, and drill in one end a hole %" deep and half the maximum diameter of the end screw on the bit. Turn the dowel on the screw by hand and insert it in the original hole. Several of different diameters can be kept on hand—W. T.

Tough..but oh so gentle

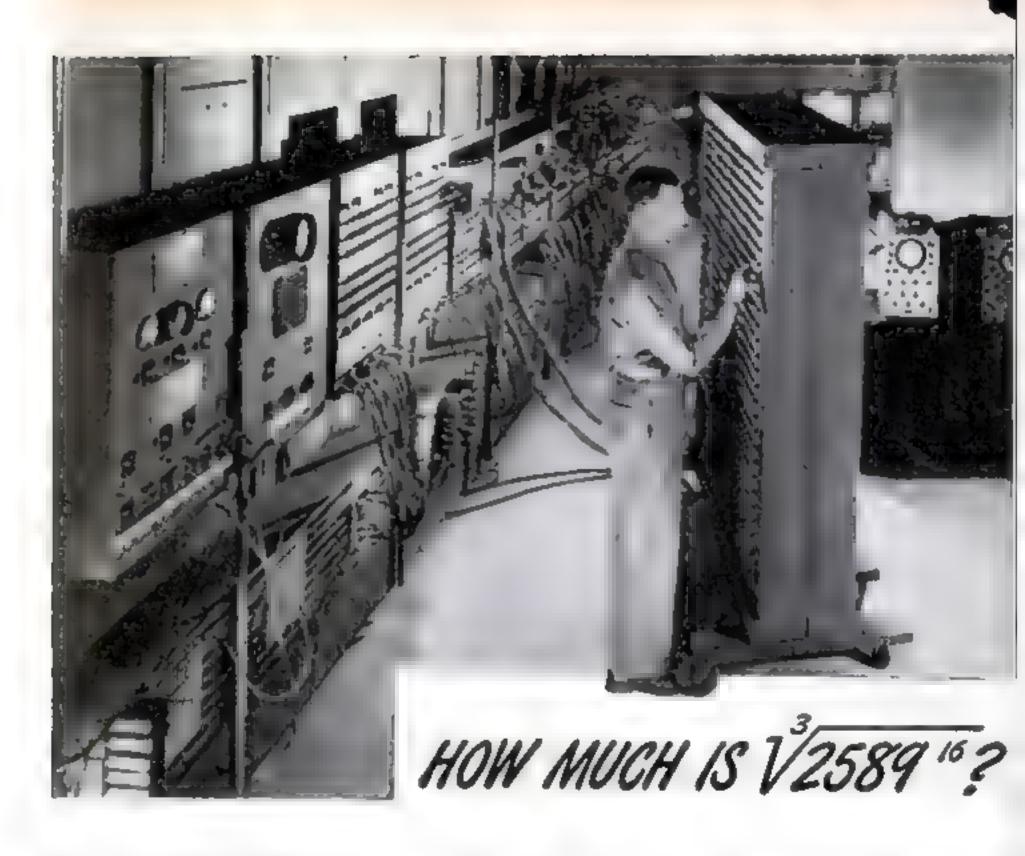

When you install new piston rings, it will pay you to get Hastings rings. They stop oil-pumping, check cylinder wear, restore engine performance.

Ask your motor specialist.

### Guard Against Skin Diseases

FLEXIBLE, lightweight, transparent garments, fashioned of compar, a limestone-coal-and-air derivative that is impervious to oils and solvents, are protecting industrial workers and helping to stamp out dermatitis. Developed during the war by the Resistoflex Corp., of Belleville, N. J., the material is highly resistant to abrasion and tearing and is made into caps, smocks, aprons (above), gloves and sleeve guards.

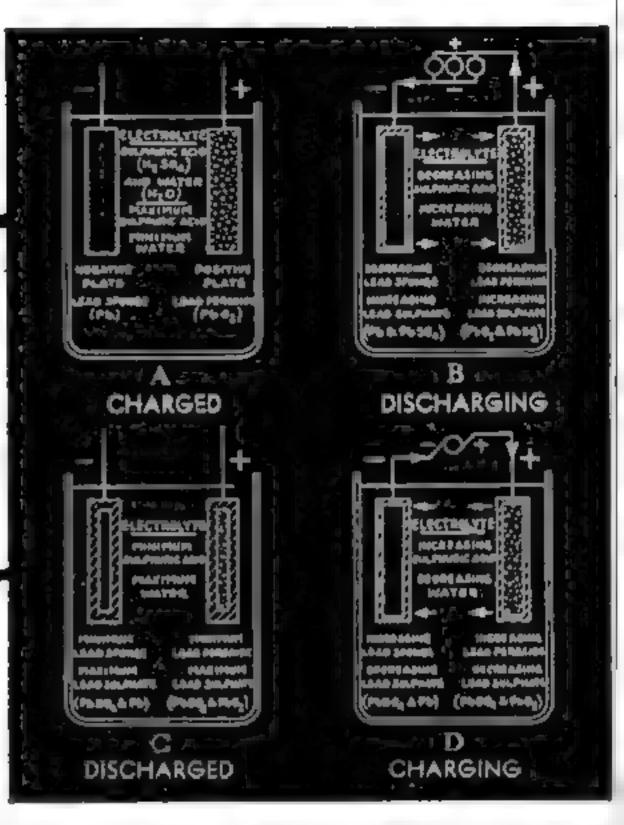

### **Delicate Welding Operation**

DEFT, steady fingers are needed to spotweld tantalum grid wires (.007" diameter) to this tantalum sleeve used in a VT90 transmitting tube, a product of the Amperex Electronic Corp., of Brooklyn, N. Y.

SAFE HEADLAMPS ARE "CORRECTLY ALMED" MEADLAMPS—HAVE YOURS CHECKED TODAY

# WHAT GOES ON INSIDE A BATTERY?

The pictures tell the story. When a cell (A) is fully charged, the negative plate is lead sponge (Pb), the positive plate is lead peroxide (PbO<sub>2</sub>), and the specific gravity of the electrolyte (sulphuric acid, H<sub>2</sub>SO<sub>4</sub>, and water, H<sub>2</sub>O) is at its maximum.

When discharging (B), the H<sub>2</sub>SO<sub>4</sub> is divided into H<sub>2</sub> and SO<sub>4</sub>.

The H<sub>2</sub> passes to the positive plate, liberates some of the Ph and combines with the plate's oxygen to form H<sub>2</sub>O, thus increasing the water content of the electrolyte.

The SO4 combines with the liberated Pb

and forms lead sulphate, PbSO<sub>4</sub>, on both plates, reducing acid content and specific gravity of the electrolyte. When sp. gr. reaches 1.150 the battery is discharged (C). When recharging (D), the current flow and chemical changes are reversed and the plates and electrolyte returned to their original condition.

Because of lower capacities, some batteries discharge more rapidly than others. Exide Batteries are noted for their high capacity, long-life, low cost per mile of operation and strong starting power.

# "WHEN IT'S AN EXIDE YOU START"

insist on them! Insure championship performance and dependability in every engine you operate -automotive, aircraft or marine-by insisting on dependable Champion Spark Plugs. Champion Spark Plug Company,

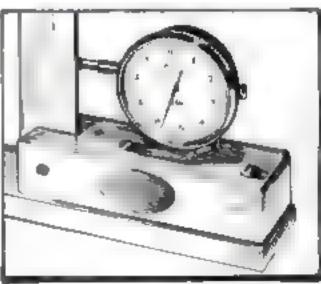

# New Micro Square Instantly Checks Right Angles to One 10,000th Inch!

Ideal for precision testing, the Acro Micro-Sine Square quickly and accurately checks right angle work to 1/10,000th inch within a given distance. Its standard indicator dial instantly registers error, location of error, and amount of correction required. Designed for tool and die shops, machine shops and testing laboratories, it also provides a standard for checking master squares, tri-squares and tools.

The Acro Micro-Sine Square is very simple to operate, saves hours of time. Made of hardened tool steel, in ground and lapped precision construction. Available in two types: (1) Standard precision gauge in tenths, (2) Lever indicator in thousandths. Both complete with master checking blocks and carrying cases.

On precision jobs, requiring a static position and mental alertness, workers undergo nervous tension which often results in fatigue. Tests have shown that the act of chewing helps relieve tension—helps workers stay alert, thus increasing their efficiency to do more accurate work. For this reason, many plant owners arge workers to chew Wrigley's Spearmint Gum on this type of job.

Standard Indicator Dial

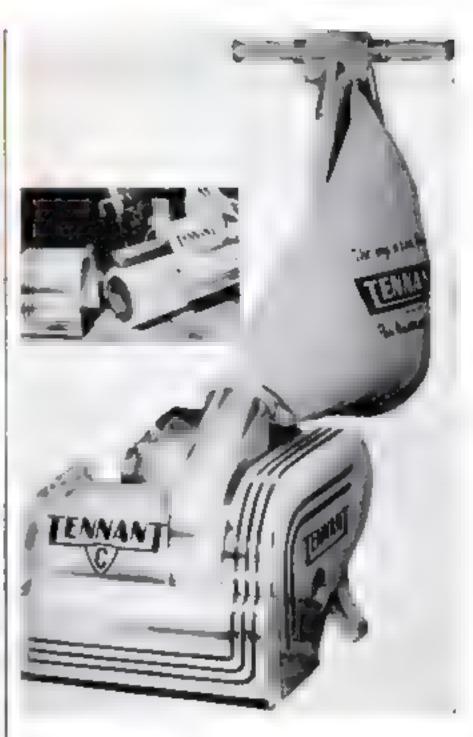

Gillette Safety Razor Company, Boston 6, Mass.

Factory-recommended AC's, of correct Keat Range for today's fuels and driving speeds, help millions to be punctual. Have your plugs checked to be sure that you have the right plugs for today's driving and fuels.

# Speeding Up Floor Cleaning

CLEANING, waxing and polishing may be done in one operation with this floor machine, put out by G. H. Tennant Co., Minneapolis, Minn. Accessories are available for scrubbing, sanding and sweeping floors of factories, offices, schools, hospitals, etc. The machine works on wood, asphalt, cork, inoleum and concrete.

# Magnets Take on New Shapes

DISPROVING the common belief that magnets have to be hard, General Electric engineers have developed two soft enough to be machined. They are cunico (copper, nickel and cobalt), and cunife (copper, nickel and iron), so ductile they can be shaped into plates, made into screws, punched out in square and circular shapes, and even drawn out into wire.

During the war, cunico was used on tachometers, on small timing motors and in gyroscopes. Cunife was used as a meter magnet to indicate whether airplane wing flaps and landing gear were up or down. Wide peacetime uses are forecast for them.

# TO THE MILLIONS OF MEN WHO THINK THEY CAN'T TAKE A PIPE...

# Why be a Pipe Exile? SMIOKE-Control SMIOKE-Control

Assures Pipe Comfort through a great New Invention

The one big reason so many men give up pipes is that the smake-volume in a standard pipe is too heavy—they can't "take it" ... Royalton craftsmen set out to build a pipe that any man could smake—that would allow the smaker to cut down or increase the draft to suit his personal preference ... That pipe is here now ... The Smake-Control feature is a simple adjustable valve which widens or narrows the opening through which smake flows. You can set this valve so that you draw in the exact amount of smake for your taste and throat. Ask your dealer to demonstrate Royalton Smake-Control.

OTORCYCLING - "the world's greatest sport" - is now at a new peak of popularity. In every section of the country-more motorcycle fans want Harley-Davidsons than ever before. Even with our production at an all-time high-dealers are selling Harley-Davidsons faster than we can produce them. That's why it's important to see your dealer EARLY - if you want the excitement, fun and thrills that go with owning a Harley-Davidson Motorcycle, Because the newest models have everything you've always wanted in streamlined beauty together with power, speed, and stamina - they're well worth waiting for until your dealer can make delivery of your -Harley-Davidson!

## **Power-Truck Service Station**

A REVOLVATOR hydraulic elevator here is being used for servicing power trucks. Its platform consists of one longitudinal and one transverse H-beam. A sump pit is provided for lowering the ram so that the truck can be driven directly onto the platform. Adjustable axle blocks, fore and aft, hold the elevated truck in position with wheels turning free.

# Tiny Sprayer Makes Big Fog

A TINY precision sprayer for insecticides, lotions, antisepties and deodorants throws billows of mist with a single stroke of its 2%-inch piston. One push develops an average nozzle pressure of 300 pounds. The working parts of the 8-ounce sprayer, which is made by the Cornelius Company, Minneapolis, are of machined brass and stainless steel. It can be held in any position without leaking.

Motoring troubles multiply, too, when spark plug wires are old and worn. So, it you want peppier, smoother, more economical per-

formance from your car—the right thing to do is replace with Packard ignition cable

The fact is that worn-out spark plug wires may be wasting as much as one gallon of gas out of every ten because of sluggish motor performance. When that new Packard cable takes over the job, you're in for thousands of better driving miles. The name "Packard" is your assurance of the best in cable materials, the best in cable design, the best in cable construction.

The makers of leading cars, trucks and buses specify Packard ignition cable as original equipment; most leading garages and service stations rely on it for replacement. That's a pretty reliable tip-off that you'll be right with

Packard cable!

### THE ONLY BRUSH THAT

# Keeps the Air Clear as it Cleans the Floor

Sweeping Compound!

brushes used with Arbitrin sweeping fluid are 100 times more effective in controlling dust than ordinary floor brushes used with sawdust When used daily, Dustless brushes actually reduce bacteria, normally in the air between sweepings, as much as 97%. These facts have been proved in tests made by independent health authorities. Dustless brushes are used in thousands of stores. factories, offices, schools, and institutions, They are unconditionally guaranteed to meet your requirements. DEALERS WANTED

WESTERN AVE., LOS ANGELES 44, CALIF.

When Writing Advertisers Please Mention Popular Science Monthly

Setting up your own shop is usually a one-time investment — for a lifetime of dividends.

Whether you have in mind the highly practical part of such a fascinating hobby — building and repairing home equipment — or will use the shop in your business, you need precision tools of wide versatility.

Atlas engineers had that in mind when they designed the 4 Tool Team.

Accuracy in construction and operation, of course, was basic. Then they made sure Atlas tools could handle all the types of

machining you might require. Next extraheavy castings were designed to assure solid machines for smooth operation even under unusual loads. Finally, they devised ingenious production methods, new to the industry, to bring you the tools at lower cost.

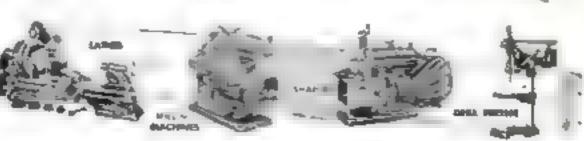

These are just a few of the many advantages developed for you in Atlas tools. Ask your Atlas distributor for specific operating features of the tools you need right now.

### "Success Stories" - FREE

Just off the press? Read how other men have realized their ambitions with Atlas tools. Shows photographs of small shops from coast to coast with reports of personal progress and success. Sent free with latest Atlas catalog. Write Atlas Press Co., 1055 N. Pitcher St., Kalamazoa 13D, Michigan.

# Versatile Small Gas Engine

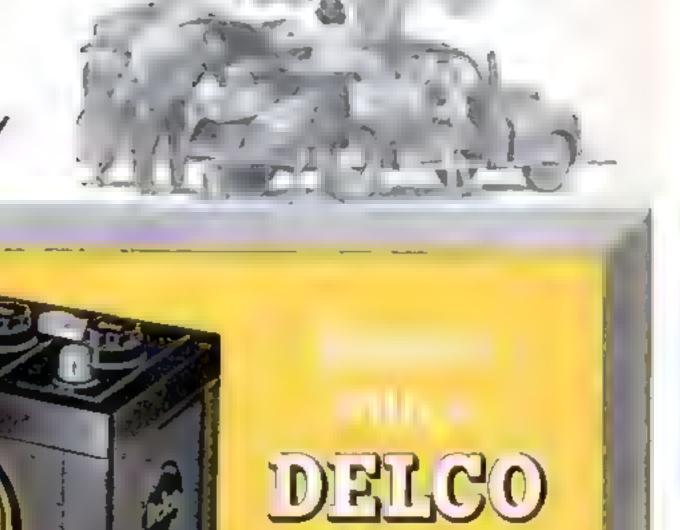

A NEW 40-pound gasoline engine developing 1-1.5 hp. at 2,000 to 3,600 r.p.m. is being made by the Chinton Machine Co., Clinton, Mich. It is designed to power lawn mowers, scooters, pumps, refrigeration units, and even small boats.

# Provides Dry Heat for an Hour

Quick heat for first-aid uses is provided by the Redi-Heat Block, made by the Mine Safety Appliances Co., of Pittsburgh, Pa. Weighing only 22 ounces, the pocket-size container holds a replaceable metal cylinder with a new chemical compound in it. A spring-loaded lever starts the action, which provides heat for an hour.

FITS AS IT GRIPS . . .

AND IT HOLDS

Utility pipe wrench

Portable land vice

New, different, offering sensational advantages over old style wrenches, the BMC Pressure Lock Wrench takes hold lightly or with more than a ton pressure. and it holds, even when you take your hand away. Releases with the flick of a finger. Quickly adjusted to fit any size piece within its maximum size range. Gripa tightly without close adjustment.

Jaws Always Parallel

By an exclusive, patented device that moves the jaw end of the toggle to accommodate for varying sizes of grip, the jaws of the BMC Pressure Lock Wrench are always parallel when they close—an important feature that prevents rounding of nuts or

deforming square or irregular pieces. It means even pressure and a solid grip when used as a vise or clamp. And it means that the tool holds to the very tip of the jawa . . . especially handy in difficult-to-reach places.

New BMC HUSKY

A giant-use BMC with 11" leverage and a  $1\frac{1}{2}$ " jaw manning . . . especially proportioned and built for extra heavy service.

On sale at leading hardware, auto equipment and mill supply stores.

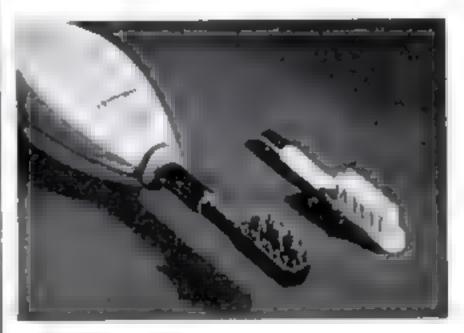

No. 7— ½" jaw opening—Price \$2.45 No. 9—1 " jaw opening—Price \$2.95 No. 11—1½" jaw opening—Price \$4.60

### Waterless Electric Radiator

Designed for temporary or supplementary heating, an electric radiator produced by Henry J. Morton Associates, Inc., of Detroit, gives off both convected and radiated heat and uses no water or other liquid. Light enough to be carried about, the radiator comes in five- and eight-section plug-in models for 110-volt current, and a 12-section model that can be wired into a 220-volt circuit.

## Aluminum Broiler Is Versatile

PLACED over any frying pan, the electric unit made by the Broilmaster Company, of Chicago, is merely a broiler. Turned over and placed on its stand, it becomes a hot plate for toasting, frying or boiling.

# Plate and Cup Molded as Unit

For meals eaten without benefit of a table, the New Plastic Corp., of Hollywood, Calif., offers a molded plate and cup to lessen the hazards of cup juggling. Notches in the extended lower edge of the cup fit snugly over ridges that divide the plate into three sections, so that the two pieces can be used as a compact unit or separately. The plate and cup are compression-molded of melamine or urea formaldehyde plastic, which has no effect on food or liquids, however hot, that come in contact with it. The plate and cup may be washed in boiling water, but soaking them for a long time in either hot or cold water is not recommended.

# Better Artificial Limbs Sought

AMERICAN inventors and engineers are urged to submit ideas for better artificial limbs to the National Inventors Council, Department of Commerce, Washington, D. C. The chairman of the Committee on Prosthetic Devices, Dr. Paul E. Klopsteg, says better joint mechanisms, lighter materials, improved fabrication, and better fitting methods are needed to care for 17,000 war casualties and an estimated 25,000 civihan amputations annually.

fumbling, no lost places, no lost time. Just put it in your book when you start reading. It holds your place to the last page.

INTRIGUING . . . Mechanically perfect, it may be personalized with engraved initials on page separator. Packed in a smart box with instructions for use on inner platform.

The prayers of the most worthy people often fail. Why? The unworthy often have the greatest health, success, riches and happiness. The best, smartest, and most industrious people often have only pain, poverty and sorrow. Why? Thirty years ago, in Forbidden Tibet, behind the highest mountains in the world, a young Englishman found the answers to these questions. His eyes were opened by the strangest mystic he met during his twenty-one years of travels in the Far East, Sick then, he regained health. Poorthen, he acquired wealth and world-wide professional honors. He wants to tell the whole world what he learned, and offers to send a 9,000 word treatise, FREE, to everyone who asks promptly. It is a first step to the POWER that KNOWLEDGE gives. There is no obligation. Write for YOUR FREE COPY today.

#### Hole Driller for Loose Leaves

Wrrst the Smead Kwik-Twst Drill, it is a simple matter to cut quarter-inch holes through a half-inch pile of paper with little more than a twist of the wrist. A celluloid template is furnished for drilling holes to fit all types of loose-leaf binders. Extra bits are obtainable.

#### No Excuse for Dull Knives

Caraotov-cemented carbide, a war-developed metal rivaling the diamond in hardness, has been put to use by Carboloy, Inc., as a knife sharpener of exceptional efficacy. Two or three swishes of a blade across the surface of the sharpener prepare a knife for almost any cutting job.

Teleran pictures-air traffic control by radar plus television.

## Teleran - radio eyes for blind flying!

Teleran (a contraction of TELEvision — Radar Air Navigation) collects all of the necessary information on the ground by radar, and then instantly transmits a television picture of the assembled data to the pilot aloft in the airplane.

On his receiver the pilot sees a picture showing the position of his airplane and the position of all other aircraft near his altitude. This is superimposed upon a terrain map complete with route markings, weather conditions

and unmistakable visual instructions to make his job easier.

Teleran—another achievement of RCA—is being developed with Army Air Forces co-operation by RCA Laboratories and RCA Victor. Moreover, when you buy any product bearing the RCA or RCA Victor monogram, you get one of the finest instruments of its kind science has yet achieved.

Radio Corporation of America, RCA Building, Radio City, New York 20... Listen to The RCA Victor Show, Sundays, 2:00 P.M., Eastern Standard Time, over the NBC Network.

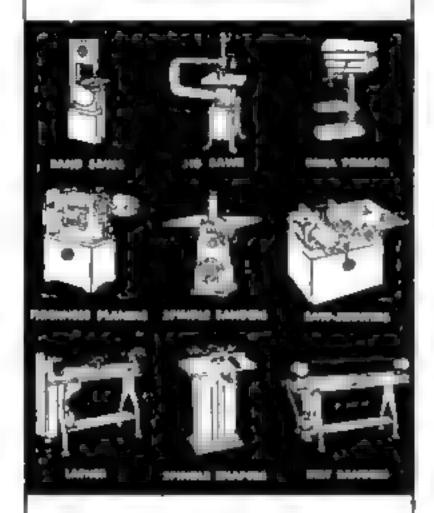

Instrument Panel of the Future. The Teleran indicator, mounted in a cockpit, greatly simplifies the pilot's job with its quickly understood picture showing his position relative to the airport and to other planes in the vicinity.

#### Plastic Raincoat for Hats

A CIVILIAN adaptation of the waterproof hat covers worn
by service men during
the war is now available. Called Rainat,
the cover is made of
transparent vinyl plastic film, and is provided in three sizes.
An elastic band makes

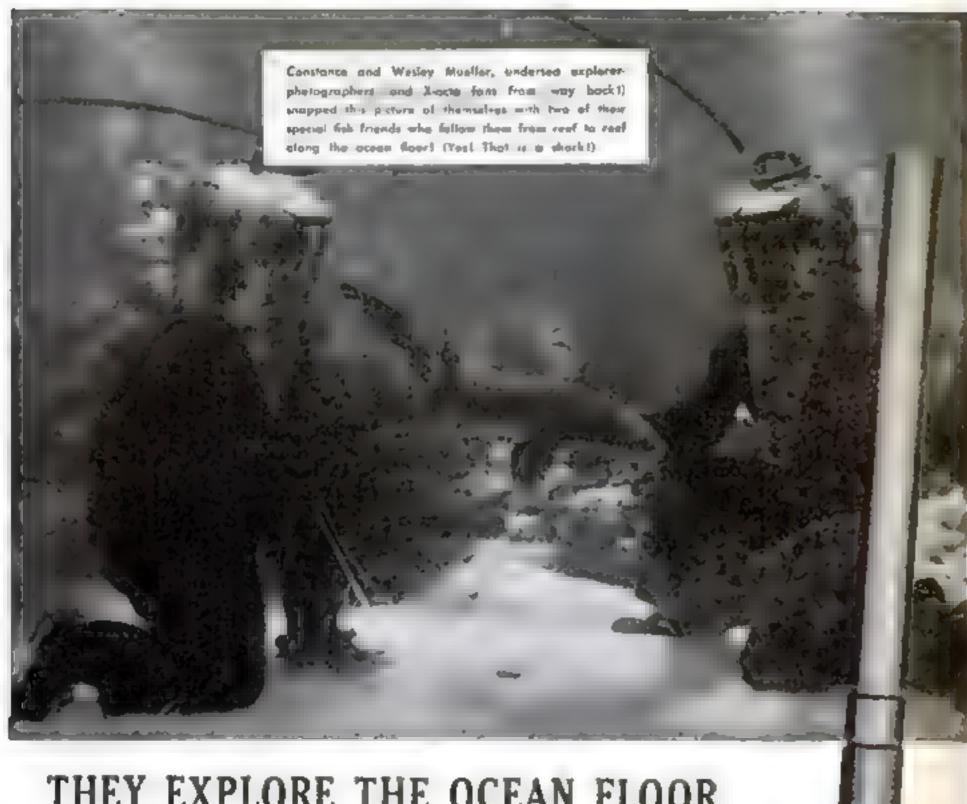

it easily adjustable to various widths of brim. When not in use, the Rainat can be folded to the size of a handkerchief, put in an envelope, and carried in even a small pocket (inset) as insurance against sudden rain. Nearly any size of man's hat can be protected by the cover.

## Tiny Selenium Rectifier

THE new selenium postage-stamp size rectifier developed by the Federal Telephone and Radio Corp., Newark, N. J., has

a wide range of uses, including the replacement of as many as 29 different rectifier-type tubes now used in various radio receivers. Advantages include durability, economy in space needs, cooler operation, and no warm-up period.

# THEY EXPLORE THE OCEAN FLOOR

... and find a hundred uses for X-acto

THERE'S never a dult moment in the seagoing life of the Muellers. They run the r own 40-foot cruser, do their own diving take their own photographs, and coax the "monsters" of the deep to pose for them.

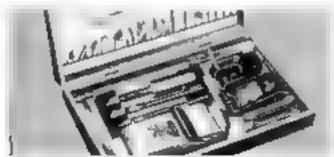

In their laboratory, in designing and repairing their equipment, in preparing their photographs for publication, they "encounter a hundred jobs requiring implements for delicate as well as heavy cutting." And that's a hundred jobs for X-actol In fact, say these exacting scientists, "X-acto Knives have now replaced a

nondescript group of tools we formerly used. because we found them stronger, saler, keener

#### 13 Blade Shapes Quickly Interchangeable!

Landlubbers, too, find X-acto Knives do their hobby and business cutting jobs, quicker, better and easier. With 3 all-metal handle styles (No more substitute plastics!) and 13 different blade shapes. X-acto is always scalpel-sharp, always ready. Amateurs or experts . . . whittlers, model builders, sculptors in paper, wood or plastics . . . choose X-acto for fun and best results.

# **GET YOUR** RADIATOR READY FOR WINTER

## CLEAN OUT RUST

with DU PONT Cooling System CLEANSER

Here's a safe, sure way to clean out rust and scale-to get ready for anu-freeze. Just pour a can of DU PONT COOLING SYSTEM CLEANSER into your radiator, run the engine for 30 minutes or more, and drain. No reverse flushing needed. No fushing with the hose or flush gun.

#### Then KEEP OUT RUST

with DU PONT

Acid and Rust INHIBITOR

After cleaning out the radiator, you can keep it free from rust all season by pouring in a can of DU PONT ACID and RUST INHIBITOR. It prevents tust forming, and keeps out acid, too.

#### AVOID RADIATOR LEAKS

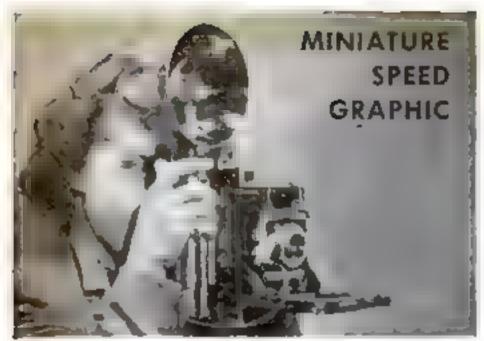

with DU PONT

Cooling System SEALER

You can stop leaks quickly and securely -and make the cooling system LEAK-PROOF-by pouring in DU PONT COOLING SYSTEM SEALER. It will not clog the radiator.

# AMAZING RADIO OPERATES FREE

Positively needs no house current, no batteries. Has no tubes. Remarkably requires no ground connection and no lengthy oldfashioned aerial. HAS SPECIALLY DF-SIGNED. RADIO IMPULSE RECEPTOR. 61/4 ft. sq. Receives local standard broadcasting stations. (Exciting long distance reception at night.) Radio gives headphone operation for personal use. Has excellent tone; adequate volume, sensitivity and power of selectivity. Exceedingly simple to operate. Can be built even by teen-age youngsters using wire and only a few ordinary, readily obtainable, reasonably priced, new or used parts. This practical radio sensation may well develop into an "ATOMIC BOMB HIT" amongst hobbyists, young and old. Be the first in your neighborhood to build and enjoy this thrilling radio. For all necessary plans and illustrations send \$1 to PAUL SEMAN, Dept. 2, 1522 Fred St., Whiting, Indiana.

# THE FOREST RODE BOOKS

These two giant volumes are packed to the brim with everything you want to know about radio—how to build and repair all types of receivers, FM sets, portables, radio-phonographs, shortwave sets, wireless record players and recorders! If you ever want to "trouble-shoot"... make your own testing instruments... check circuits... or build magnificent sets... these are the books for you! Order today! SEND NO MONEY! Just deposit price of books with postman plus few cents mailing charge. If after 7 days' free Trial you aren't thoroughly delighted return these books and your money will be refunded! 50 SEND YOUR ORDER NOW WHILE THE SUPPLY LASTS!

For the man who wants to build sets RADIO FOR

THE MILLIONS

648 Pictures!
192 Giant Pages
78 Complete Plans
ONLY \$1.98 Deluxe Edition

SAVE MONEY!
And order both books together!
BOTH AT THE BARGAIN PRICE OF ONLY \$2.98!
OR SEPARATELY:
RADIO FOR THE MILLIONS \$1.98
EVERYBODY'S RADIO MANUAL \$1.49

For the man who wants
to "trouble-shoot"
EVERYBODY'S
RADIO MANUAL

256 Pages! 216 Pictures! 75 Wiring Diagrams ONLY \$1.49 in DeLuxe Binding

Get your step-by-step instructions for radio tepairing from this clear-cut, simply written manual. Here are hundreds of pictures and wiring diagrams to show you how to solder, cut and drill... how to read diagrams, check circuits, make testing instruments, measure capacities, identify high voltages, calculate testiments, and find open circuits.

#### How To Modernize Old Sets!

Read the hig chapter on improving old radios, witting battery sets for AC current, adding phonograph attachments, and adapting sets for abort wave reception. You it find complete plans for building 11 sets including an AC DC short wave receiver, a 3-way portable, a home recorder, an FM receiver, and a high fidelity amplifier! It's just bursting with shortcuts, pictures, diagrams, conversion tables and codes! Be sure to order today!

How would you like to build your favorite type of radio? "Radio For The Alillians" gives you simple clear-cut intractions and hundreds of detailed picture-diagrams for every type of radio you will want! It shows you exactly how to build no less than 78 radios, phonographs, and combinations. There is no 8-tube FM receiver, two-way radio station, bicycle radio, 2-tube set, flour lamp radio, tiny portable, studget AC-DC set, superbet, high fidelity amplifier, all-wave receiver, bed radio, and a vest-pocket receiver! You'll find scores of NFW IDEAS, too—and read how to build hand-some new cabinets, a dual-turntable phonograph, a "B" supply for portables, a rectifier unit, a television intenna, a record player, a home recorder, and a light beam transmitter.

#### A SPECIAL BARGAIN PRICE!

Think of it! A giant book with 648 pictures, 192 pages, 78 complete plans for radios and phonographs—all for ONLY \$1.98 deluxe! Just one of the repair jobs described could have you several times small cost of the book.

## Reader

## UNLISTED Editors

In CARD FILES at the editorial offices of Popular Science Monthly are hundreds of names, with addresses and telephone numbers. If we were going to write down a list of assets, these names certainly would be at the top. For they are the names of our friends, people all over the United States who help put out our magazine.

These names don't appear on the mast-

head, but they contribute to the content each month just as surely as our artists and writers and "copy" men do. They help us get the research material for our stories. They dig into their files for buried facts. They know the value of meticulousness

Our friends help us prepare drawings and pictures, and sometimes they pose for pictures. Many are readers, but all know PSM and are glad to help us get the facts. They are college professors, prominent industrialists, Army and Navy officers, railroad brakemen, the tool op-

erators in factories, and the public relations officers of business enterprises.

This month we give you a picture of one of our friends. She is Miss Elizabeth Porrecha, who weighs all of 102 pounds soaking wet. Poured into a pair of overalls, she operates one of the multi-ton traveling cranes at the Baldwin Locomotive Works in Chester, Pa. Her fingers are slim but she can handle a 2%-

ton drive wheel as easily as a knife and fork.

For some of the pictures in this month's story on locomotives ("More Power on Wheels", p. 66), Miss Porrecha was permitted to halt her mechanical Atlas long enough to lift some locomotive parts into camera range.

"About three inches lower, please," our photographer called to Miss Porrecha on her perch, and down the subject of the photograph came, exactly three inches.

Then we asked if we could take a picture of her too. That took some time. We had to wait until she stopped blushing.

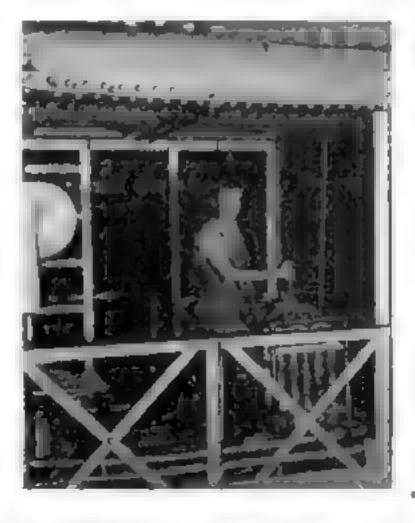

Now her name has been added to the legion of those who help us put out a better magazine for you. And ever the list grows longer. At Bikini were friends who helped us get the first of our reports on the atombomb test and then, not content with that, helped us hurry the story through by radio.

For August, friends in Hollywood helped us get the pictures of Montgomery, the glider enthusiast of the 1880's, and of the movie version of his life. For our September issue, friends helped us prepare those splendid drawings that illustrated the article, "Electrons at Work."

Next month you will see the product of the cooperation of some friends of PSM in Detroit, where we prepared an article on packaging human beings in steel. That's really what automobile design amounts to, and our story will tell how they

go about it. The designers dropped their work to help us arrange for pictures and basic text material. And many of them spent hours of their own time giving us the background of their business.

That's what we mean by having friends.

#### PRECISION-BUILT READSTOCK

The headstock construction of South Bend Precision Lathes is one of the reasons for their unvarying accuracy. Spindle bearing surfaces are superfinished to a smoothness of 5 micro-Inches (.000005") which reduces wear and friction, permits higher spindle speeds, and assures precision.

WRITE FOR FREE CATALOG. South Band Precision Lattice are made with 9", 10", 13", 14-1/2", and 16" swings. Specify size tathe in which interested.

maintenance and service, laboratories,

model shops, and many other industries.

LATHE BUILDERS SINCE 1906

BEND LATHE WORKS SOUTH 456 EAST MADISON STREET . SOUTH BEND 22, INDIANA

why the accuracy, versatility, and dependability

of South Bend Precision Lathes are as important in

the small shop as they are in the industrial toolroom and

manufacturing plant. These qualities enable them to han-

dle efficiently the many types of operations which regu-

larly are encountered in tool and instrument shops, radio

and appliance repair work, automotive and aviation

## Reports on

"Conscientious study of I. C. S. Courses proves their value beyond doubt."

R. D. CHARLES

Maintenance Superintendent
Africa-Orient Division

Pan American World Airways

L'ecords of Pan American World Airways tell you plenty about the value of I.C.S. Aviation Courses. They show that hundreds of Pan American pilots, co-pilots, flight engineers and maintenance men have taken I.C.S. Courses,

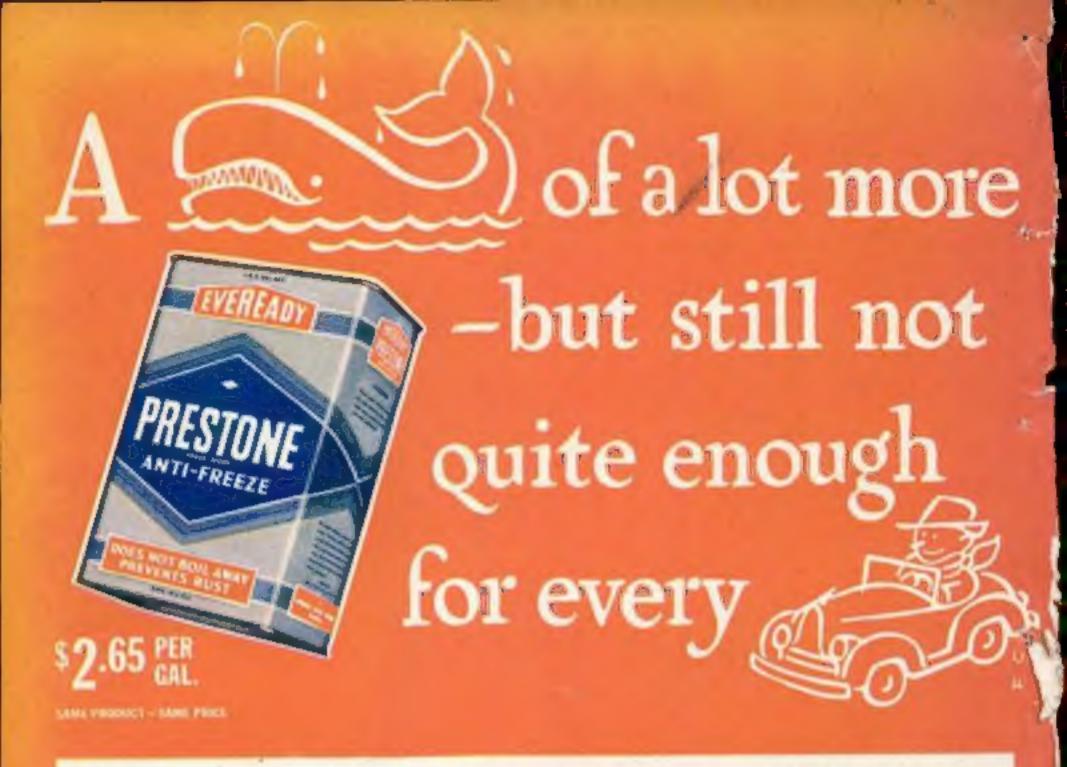

Now flying for just one division of the airline—Latin American—are 336 pilots and co-pilots who are holders of I.C.S. diplomas.

What better endorsement could there be of any institution offering training for Aviation careers?

If you are planning for a place in Aviation, you owe it to yourself to study the list of Courses on the other side of the extension of this page and to mail the coupon today for full information on the famous I.C.S. Course of your choice. Do it now!

Today, any car that runs is a good car, whether it's a '46 − or '36. It deserves protection from freeze-up − and the best is 'Prestone' anti-freeze. One shot lasts all winter − it doesn't boil away or foam off. Prevents rust and corrosion too.

There's a lot more "Prestone" anti-freeze this year ... more than at any other time since 1941.

But, with demand exceeding supply, some motorists will be "left out in the cold." To avoid freezeup damage, get "Prestone" anti-freeze early.

#### HATIONAL CARBON COMPANY, INC.

30 East 42nd Street, New York 17, N. Y. Unit of Union Carleste and Carbon Carporation

NCC.

The words "Everenly" and "Prestone" are registered trade-marks of National Carless Company, Inc.

### WHY

there's still a "Prestone" antifreeze shortage:

Prestone anti-freeze, like most other products, depends on the utilization of raw materials and equipment drawn from many fields. Recent industrial dislocations have affected our plant expansion program, which was not authorized during the war. Planned for years, it is well advanced; but the real benefit will not be felt in 1946.

2 "Prestone" anti-freeze must be produced and packaged long before cold weather. Last spring and summer the food abortage diverted packaging materials to the need of starving millions, and affected our ability to meet 1946 requirements. So your dealer may be selling "Prestone" anti-freeze from 5-gallon cans in addition to the familiar 1 gallon cans.
